But once question is WHY would anyone want to read an Amiga disk ???
You do know games run on specific Amiga hardware don't you ??

mdg@ukc.ac.uk (M.D.Griffiths) writes in article <8749@gos.ukc.ac.uk>
>Yes it does cut both ways, however the nature of the 68k instruction set
>means that it is difficult for compilers to use every 'trick', the 80x86
>with its less complex modes means that there is less redundancy, hence
>it is easier to optimise for.

I don't think you can say that a processor is more RISC like just because
the instruction set makes optomisation easier. You are probably correct in
that the 80x86 instruction set is more compiler friendly though :-)

>ok.. on a risc machine (archmedies) a compiler might produce something like:
> adr r12,array ; r12 -> array[0]
> ldr r0,[r12] ; a = array[0]
> ldr r1,[r12,#4] ; b = array[1]
> ldr r2,[r12,#8] ; c = array[2]
> str [r12],r1 ; array[0] = b
> str [r12,#4],r2 ; array[1] = c
> str [r12,#8],r0 ; array[2] = a

...

>now the RISC machine code cannot be optimised, ...

(Assuming the array elements are word sized (which your code implies)
What about this for optomising the ARMcode?

```
ADR R12,array
LDMIA R12,{R0-R2}
STMIA R12!,{R1-R2}
STR [R12],R0
```

Perhaps you would not be able to do things like this with an instruction
set less agile than the ARM's, but there are other optomisations. Eg.
Making use of the larger number of registers (you could make sure 'array'
is kept in a register for example).

>hence RISC is easier to optimise for because there are LESS ways of doing
>things, you don't have to worry about so many 'tricks' and things like
>peephole optimisation so much. Having more registers is not necessarily
>better on a CISC architecure, it is better however for writing demos ;-)
>because you can spend 3 hours optimising a routine to get an extra register
>, cut down on memory access and hence get that spinning cube running 1fps
>extra !!

Having more registers is always better! (Unless your memory runs at a
ludicrous rate, or you have a cache with a 100% hit rate :*)

>and the size of the library the compiler bolts on ;-).

:-) Hmmm. If parts of the library are not used, they should end up in the cache!

>but surely the compiler knows everything about the architecture and should
>be better than me?? ;-). How can I beat it? The answer is of course that
>a compiler is mechanical, WE are not, there is a certain flamboyance
>involved in hand coding assembler that compilers cannot match at present,
>RISC machines are simpler more powerful machines, hence compilers can
>compete better with people.

A compiler only knows as much as it's programmer tells it :-) If you were to put all your optomisation knowledge into the compiler, you would not be able to beat it. The fact that you could get far better performance out of the hand assebled 68k code is more an indication of the competance of the compiler.

: Thats because the Amiga runs the PC filing system as a mounted file
: system. The basic Amiga disk format is far superior to the PC/TOS - long
: file names, soft and hard links, more on a disk etc. If you want to access
: PC disks you simply mount a PC file system (eg CrossDos comes with
: AmigaDos 3) and you can access them transparently. Sure theres a little
: processor overhead when reading writing, but it not like you are accessing
: the floppies more than about 2-3% of the time. Are there any programs on
: the PC or Atari that let them read Amiga disks?

I don't think it's the software's fault that an Atari ST or a PC can't
read Amiga disks. The physical sectors on the Amiga disks are much
too big for PC-type controllers to read in one go. The Amiga has a
controller that can do it, however. This makes it possible to cram
in some more data on each track. You can actually have abou 960kB on
a double density disk using an Amiga (see diskspare.device!).

>RISCLIKE in this way.

The problem with the term RISC is that it no longer really means any one thing. With regard to the instruction set, a RISC processor doesn't need a small number of instructions, just well planned. (In the case of the ARM, there are no specific 'shift' instructions, but one operand to all data instructions (move, add, compare, etc) can be shifted in four different ways. Another 'feature' of the 68k is it's orthogonal instruction set, which gives it more 'RISC-ness' over the 80x86, which has a sort of spaghetti instruction set - certain addressing modes and operations can only be used with particular combinations of registers.

Now this is an advocacy group... :)

If you want to learn a lot about 3D algorithms I wouls start with the
book COMPUTER GRAPHICS (I think) by FOLEY, VAN DAM et al. I have both
editions at home. The first edition is a little easier to follow, while
the second edition is much more complete.

PASCAL is actually not a bad language to start doing graphics applications in.
I prefer using C, but used PASCAL for graphics applications for 5 years.
Though the library routines where mainly writen in PASCAL and assembler.
The rendering software was writen entirely in 68030 assembler.

Who cares about your stupid opinions, Peter? In case you haven't noticed
this news group was set up to advocate the merits of Ataris. If that is
not a subject that interests you, you don't have to read it. It is
incredibly rude to get on a news group and post that no one should discuss
the thing that the group was set up for. You are a real jerk for flaming
people because of their interest in the news group.

Now you'll probably flame me because I tell you what an asshole you are.
So be it.

Grow up.

Would you not agree though, that an important difference between the CISC and RISC philosophies is that CISC processors are generally designed to be programmed directly by humans, wheras RISC machines are designed to have code written for them by optomising compilers? CISC machines generally have instruction sets that include higher level concepts than RISC machines (for example, the 680x0 series has a memory to memory copy, wheras most RISC's would implement this by loading and storing in two seperate instructions). The advantage you get with RISC is that they go so much faster, because their instruction sets are designed around speed and optimisation. The ARM falls somewhere inbetween in a lot of ways. It's instruction set is nice from an assembly programmers point of view (as is the 68000), but compared to RISC chips with instruction sets that are a lot less freindly (eg MIPS, Alpha), it is relativley slow. A CISC chip in general will have a nice user friendly instruction set, that will probably execute in a less than optimal manner (80x86 excepting of course), wheras a RISC chip will generally execute instructions using a sledgehammer approach. The first is elegant, the second is fast. The ARM falls somewhere inbetween IMHO.

>
>Er, shurely a branch taken will generally result in a change in the PC!

Ah yes, but a not-branch taken won't. To explain this cryptic comment, consider
a (very) simple example:

```
r0=(r1==1) ? r2 : r3;
```

Without conditional instructions you need:

```
CMP r1,#1
BNE label1
MOV r0,r2
B label2
.label1 MOV r0,r3
.label2
```

...branches all over the place. Lots of code and lots of pipeline flushes.
Now add conditional instructions:

```
CMP r1,#1
MOVNE r0,r2
MOVEQ r0,r3
```

60% of the code, and no branches. Sort of. You could pretend that the
conditional instruction includes an implicit "Branch to next instruction if
condition fails". If you care to do such a thing then you'll notice that you
have a branch that doesn't flush the cache.

Conditional instructions on the ARM give rise to longer runs of sequential
code than on your average CPU. This tends to improve things on a number of
counts...

Mike.

Cross-posted to: comp.sys.amiga.advocacy,comp.sys.mac.advocacy,comp.os.ms-windows.advocacy,comp.os.os2.advocacy,comp.sys.atari.advocacy

I am posting this to the Mac/Windows/Amiga/Atari groups because let's face it they are mostly the same group (grin).

It look as if the folks at C= might have decided that a strategic withdrawl is the better part of valor.

I was looking through the Amiga magazines and saw the following tidbit (I still have and use my A1000 and so still buy Amiga mags) about the future of Amiga. The thrust of tha article was a (surprisingly honest) look at why the major players are aloof from the Amiga software market.

I will preface this clip with my predictions... (sprinkle smileys)

1) Future Amiga's will be PowerPC based.

2) We will se a lot more support for the virtue's of NT than we used to!

================ Begin Clip ======================

Amiga Shopper
(printed in England)
[from the makers of Amiga Format]
Issue 34
February 1994
Page 16 (Article is on pages 14-17, 20-21, 24, 26, & 28-29

David Pleasance, Commodore UK (recently installed) Managing Director

"I think in this country we've been spectacularly unsuccessful at properly positioning the A4000, A3000 or even the A2000, for that matter, as a serious machine."

To which he adds, bullishly: "I can absolutely promise you that is all set to change."

Seeing that Microsoft have more or less ignored the Amiga, how does he view the future? Given that the machine is going from strength-to-strength, it seems reasonable to suppose that the big guns cannot afford to ignore it for much longer. So is it likely that Microsoft will ever develop for the Amiga?

"No," he replies with confidence, "but they won't need to."

"The new generation of machines have a RISC core, will be DOS compatible and will run Windows NT. We're taking a 64-bit RISC processor, adding to it a 3D rendering engine with texture mapping and so on -- all included on

the chip -- and we're wrapping it with the AAA chip set. We're currently predicting a performance ratio compared to AA [AGA] chip set of somewhere between 10 & 20 times current speeds. This will form the heart of new high-end workstations and you'll have full compatibility with DOS -- no bridgeboards required."

It sounds to good to be true, but Pleasance claims the new machines will run all the current Amiga software too. "The head of Research and Development team, Lou Eggbrecht, is the best in the business. He was head of the design team that produced all the chips for the IBM PC; he also worked for Franklin computers [no connection with Steve Franklin], a company that very nearly produced a Macintosh clone, before going bankrupt a few years ago.

"Virtually anything you care to mention, he's been involved with. Moveover, the first-pass silicon on AAA was over 95% functional -- a performance that was previously unheard of."

================ End Clip ========================

:>
:>what do you mean boring hardware? Atari's hardware is way behind!!!No 040 and
:>Power PC Atari's to speak of.

I'll explain it more slowly for you...

Just because a CPU is more powerful doesn't mean that a computer is more
exciting, the MAC h/ware is boring, the Falcon is sophisticated at a h/ware
level and very flexible and programmable - the MAC is not. Even though
the PC and MAC maybe more powerful for applications than a Falcon they
are *NOT* more exciting in terms of h/ware. My 486 can do most things
faster than my Falcon *however* it is not as modern and exciting in
terms of its h/ware. God help the world if everyone is as boring as you.

-======

I would like, as a person who has muchos hours on both machines, that the famed
speedy redraw rate on Falcons (even with ScreenBlaster) is only true for ST
High resolution - 2 bits deep. Try putting the sucker on 256 colors, single
line and fall asleep while the menus pop down. Most 040 macs are running a
640*480*8 screen, rather than a 640*400*1 - thats more than 8 times the video
throughput.

Besides, there aint much that runs on Falcons except in ST high anyhow. OK,
Works, but THAT is no killer app!

>
>Er, shurely a branch taken will generally result in a change in the PC!

A condition being false may not result in a change of PC unless the
instruction is :

B<CC> addr (in which case the pipeline will be flushed)

if we have

STR<CC> and the condition is false then it is the same as executing a NOP.

sorry for the confusion, the change in PC I was referring to is if you
add or subtract to the PC (r15)...

PC's rules the home and probably business markets now. Lots of typing
pools are being replaced by a few secretaries, PC's and automated
mailing list software.

: I'm sure HP, Sun, and the other manufactureres of workstations will
: be thrilled to hear this but they must be really wondering who their
: secret competitor is who is selling all those workstations.

: You really should have included a smiley or something. Nobody could
: be that out of touch. 8-)

It's probably only valid for educational environments, especially
Comp Sci and Electrical Engineering degrees. I doubt if London School
of Economics is stacked high with workstations, more likely PC's
with Word and Excel and perhaps Latex.

Workstations are ideal for multi-user setups and run Unix quite well.
Though, there are PC based Unix's around, Linux (free) and Coherent
(buyware) come to mind.

>them by optomising compilers?

Well I will defend Dave here... the Archimedes Risc CPU is a bit
of a special case, from my own experience it is EASY to thrash the compiler,
mainly because the Archimedes does not suffer from pipeline stalling and
instruction ordering problems which us humans are bad at spotting. You
are right in saying that RISC is generally better to leave to the compiler
however, it is wrong to generalise that a compiler will always be better
than a human, because machines cannot compete with us for intuitive problems
and do not have the same approach to optimisation as us. An expert human
in a field will always beat a machine (i.e. chess etc...).

:>CISC machines generally have instruction sets that
:>include higher level concepts than RISC machines (for example, the 680x0 series
:>has a memory to memory copy, wheras most RISC's would implement this by loading
:>and storing in two seperate instructions). The advantage you get with RISC is
:>that they go so much faster, because their instruction sets are designed around
:>speed and optimisation. The ARM falls somewhere inbetween in a lot of ways. It's
:>instruction set is nice from an assembly programmers point of view (as is the
:>68000), but compared to RISC chips with instruction sets that are a lot less
:>freindly (eg MIPS, Alpha), it is relativley slow. A CISC chip in general will
:>have a nice user friendly instruction set, that will probably execute in a less
:>than optimal manner (80x86 excepting of course), wheras a RISC chip will
:>generally execute instructions using a sledgehammer approach. The first is
:>elegant, the second is fast. The ARM falls somewhere inbetween IMHO.

Yes the ARM is best CPU I have ever programmed, it is not the most powerful,
the DSP 56001 in the Falcon is the most powerful single chip I have coded
myself (better than most 486s in my opinion but *much* more
difficult to program).

Even though the ARM is more RISC it is noteable that for MOST things you
can do more in one instruction than a 68000, an example of this is a
mandel-brot generator I wrote, which was half the codesize as a 68030,
yet 3 times as fast. MPYA etc...

Alan, A PC is better value than a Falcon (I own both), for the majority
of people a PC will do what they want and do it more cheaply, the Falcon
is a more exciting machine, but it will always be a niche machine.

No, Apple as usual intends to forge its own, incompatible and proprietary
path into the future (with cheezy software emulation as a fall-back) and
will not offer other operating systems on the PowerPC Macs other than
System 7.x.

>Besides, how many non-Intel machines are _currently_ running NT anyway.
>Wasn't the rumor that DEC had only shipped <1000 Alpha PC's with NT
>installed? Methinks anyone who still believes "NT will take over the
>world" has, at the very least, a long wait ahead.

The most-often quoted figure was 500 DEC Alpha/NT machines shipped. Demand
is just not that high. Much higher is the demand for OpenVMS and OSF-1
(64-bit Unix) on the same machines, which are quite snappy performers when
running real operating systems (grin)

How soon people forget the cries of "Windows NT everywhere!" that swamped
every single mainstream PC mag over the last two years...

Incorrect as usual - no-one on this group for at least a month or two
has EVER denied that such machines are sold - the only statement made
is that they are not the "base" model Falcon for which all programs will
be developed. Just as 486 Motherboards are sold to those who wish to
add components seperatley to a machine, so are 1MB Falcons sold.

This part of your letter says that an A1200 with an 80Mb HD, 4Mb FastRam and a
50Mhz accelerator can be had for 79GPB more than a base Falcon.

Nice to see the names, I will have to check this out.

GM> Its worth noting that you can get an A1200 with 6megs of RAM (4 megs of
GM> it fast) for the same price as the cheapest 1 meg Falcon I`ve seen. For
GM> the price of 4 meg f030 with HD wou can get an A1200/6megs/HD/SCSI/25Mhz
GM> 882 unit which I think is very competitive.

This part says that you can get A1200/6Mb RAM/HD (size?)/SCSI/25Mhz 68882 for
the SAME price.

...and yet you forgot to tell me WHERE!

Well I wouldn't be surprised to see an ARM in a washing mashine.
1) There are industrial washing mashine that require a lot of sw control
2) Some standard bog washing machine include fuzzy logic controllers...
not that it's needed, but it sells a lot better!

>them by optomising compilers?
Hmm. True, a lot of old processors were designed with convenience of human
coding in mind, hence lots of instructions to do flashy things, and a
modern processors are designed with no thought of human convenience - this
becomes important when processors have huge pipelines which mean that
instructions have to be carefully scheduled for optimal performance.
However, this is more about incredibly fast modern pipelined architectures
than RISC-processor-ness (for example, the 586 is not a RISC chip, but
is best suited to an optimising compiler).

The ARM architecture could be implemented with huge pipelines and all sorts
of scheduling stuff to make it a super fast chip, just as a chip could be
designed based on the Alpha architecture having no flashy pipeline stuff.
Both would still be just as RISC (and probably about as likely).

> CISC machines generally have instruction sets that
>include higher level concepts than RISC machines (for example, the 680x0 series
>has a memory to memory copy, wheras most RISC's would implement this by loading
>and storing in two seperate instructions).
This is true, and this is the basis of the RISC concept: instructions that are
not entirely necessary are scrapped. Or rather the instruction set is designed
from scratch without them in. As I have said, this doesn't necessarily leave
you with a tiny instruction set, or mean that several instructions are always
needed to perform one equivalent CISC instruction - and often in cases where
more instructions are needed, compilers for the CISC architecture will
frequently not make use of the CISC instruction anyway (eg. x86 compilers
don't (in my experience) compile block memory transfer/fill loops into the
single 8086 instruction equivalent).

> The ARM falls somewhere inbetween in a lot of ways. It's
>instruction set is nice from an assembly programmers point of view (as is the
>68000), but compared to RISC chips with instruction sets that are a lot less
>freindly (eg MIPS, Alpha), it is relativley slow.
This is not necessarily because the ARM isn't as RISC, merely that the
people at ARM don't feel (probably justifiably) that there would be
sufficient demand for an ARM with all the modern processor optimisations:
all the ARMs advantages of power/speed, price and die size, would be
compromised.

> A CISC chip in general will

>elegant, the second is fast. The ARM falls somewhere inbetween IMHO.
I'd be inclined to consider the two separately: on an elegance scale, the ARM
instruction set is one of the best; on the speed scale it's middling. This
is, of course, all MHO.

>The LUT is only 256x3 dsp words for each playfield (R,G,B words ? ok)
>The cpu sends only one of the playfields (64k)

hmmm. I would have thought that there were 256*256 possible
combinations for any given pixel giving 65536 outcomes, each of which has
needs two bytes to decribe the chunky pixel. Of course, many of these will
be duplicates so you _might_ be able to get away with a half size table
making it only 64Kbytes in size. A friend of mine used a similar LUT
scheme to do digital noise reduction of old b&w films in hardware using an
EPROM.

>ooppss you forgot about the sound dma, answer your question for you!

No it doesnt. Even assuming the sound DMA isnt just hardwired to the
DACs to make the sound, it would only be able to fetch from memory to the
DSP, not help in sending any of the data back. How are you going to
syncronise all the data coming from the sound DMA and the host port? And
what about the additional access needed to make any updates to the
playfield held in the DSP? What about making sounds?

>> [lots of stuff deleted]

>about 40,000 clock cycles (about 10%?).

Yes, cutting down the screen size would eventually bring the amount of
memory needed to be shifted to a reasonable enough size to fit within bus

bandwidths, thats why I made the comment about cutting down the rez to 160x100 later in the post. It still doesnt leave the CPU with any time to do anything but shift memory. That will require further reductions in screen size/frame rate.

The real limit isnt DSP processor power, but instead the rate at which the CPU can do memory<->DSP xfers. Having quite a small amount of memory in the DSP wont help when trying to do scrolling either. Theres going to have to be a very repetitive scrolling background.

>:> I may not be a Falcon/DSP programmer, but I dont need to be in order

>proved
>above that it is nearer 25fps. With this claim I am right.

I havent seen any proof that you can achieve anything near 25FPS with any sort of usable screen size. All you have proved is that when you have 65k colours, you can use a software algorithm to work out the effect of two overlapping 256 colour screens. I`ve pointed out that this DOES NOT equate to providing twin 256 colour playfields as bus bandwidth and CPU time considerations mean that this is impossible at the 25FPS you claim. You can for example, use any high colour screen to emulate an alpha channel effect, but its not the same as providing a real alpha channel.

>:>You just kept spouting on. Never mind, maybe if you cut down the rez to
>:>160x100 you MIGHT be able to physically shift enough memory to make a
>:>display, even if there was absolutely no processor time to do anything

>actually for the 1600x600, mode I have it displaying 128x600 at the
>moment ;-). I always said this was theoretical, but 1600x600 in other
>modes have been acheived,

As I said above, I was talking about cutting the rez to make the `dual playfield` effect you describe be physically possible, not talking about your equally unfeasible 1600x600x65kcolour screen.

>:>>In this case I am *correct* because the DSP can loose the need for a

>LUT
>:>and playfield niggle, but you did *say in your post*:

>Yeah, perhaps you should have read the whole post before replying and
>jumping to slagging me off so quickly. You just went back on everything
>you said.

I did see the whole post. You started off by talking about using an LUT and at the end changed it to `real time calculations`. Seems like you didnt think things out at the start. Thats why I pointed that out in my post.

> I'd prefer not to argue about this, its going to end up
>with me saying something like 'ok.. i'm wrong it goes at 24fps and not
>25fps. ok? pedantic pedantic pedantic.'

It going to end up with me proving something like `you can do 160x100 in 14 FPS with 100% CPU contention` or some such similar spec.

You should really think about things before you claim them. I could claim, for example, that you can get true 24 bit colour on an AGA Amiga. How? By setting up a 256 colour screen with 256 vertical bands of successive colours and reloading the colour registers on each hblank. In theory, very possible, in practice I suspect not. But I dont go around making such claims without thinking them out first.

>Griff

I`d still like to hear how many _BYTES_ of memory the DSP has, how wide the `Host port` is and the memory and task management facilities of the OS with regard to the DSP.

Gavan

>those only affect looks, not functionality). There are separate utilities
>for specific purposes (filemanagement etc.), but that's a clumsy way to
>do it.

I`d argue that the basic Amiga desktop is a lot more functional than
the basic GEM desktop. One of the reasons GEM users slag off intuition is
that GEM is a lot simpler to use, and that is a result of it having a lot
less features. Hence the need for replacement Desktops.

I think its better to have a powerful, standard, compatible desktop
than to have loads of seperate desktop add-ons. The features of the Amiga
such as screen switching and AREXX make integrating file-managament type
programs such as the excellent Directory Opus, very easy.

My only regret is that you need a VGA or Multisync to get the full
benefits of the Amiga desktop - after seeing a friends A4000 running
MagicWB on a multisync, its hard to go back to using a Phillips 8833. This
is probably true for most modern GUI systems though.

>be developed. Just as 486 Motherboards are sold to those who wish to
>add components seperatley to a machine, so are 1MB Falcons sold.

Yes, recently Falcon owners have started to admit that you can
actually buy 1 Mb Falcons, although only after I stated I had seen
advertisements for them (an unusual occurence with the Falcon!). Before
that there was total denial. Now its the line `for expansion only`. I
presume when you buy such a machine that they surgically implant a bomb in
your chest that blows up if you dont immediately buy 3 more megs and a HD?
If they are for expansion only then why include any memory AT ALL?

Seems to me its a ploy to sell more as they`ve seen how the A1200 sold
loads of 2meg chip/no HD machines and they realise that people will buy
the cheapest machine and then upgrade with memory and HD later as they can
afford to. I ran my A1200 with only 2 megs and 2 floppies for 8 or 9
months until I could afford a HD and more memory, and was able to do C and
AMOS programming on it.

I assume we can suppose you have a DWIM compiler which can translate this
code into what you actually meant.. (ie. array[0]=b;array[1]=c;array[2]=a;)

>ok.. on a risc machine (archmedies) a compiler might produce something like:

Point below noted about ARM being an exception since it DOES have more
complex addressing modes. (Any idea if Norcroft C does handle this?)

>however on a 68000 a compiler might produce
[Functionally identical 68000 code]

>now the RISC machine code cannot be optimised, since it only has ATOMIC

```

> move.l d0,8(a0)
Yes - very clever optimisation... Any C compiler can only do so much to optimise poorly written code though. I wonder what the 68k compiler would make of:
t = array [0];
array[0] = array[1];
array[1] = array[2];
array[2] = t;

>hence RISC is easier to optimise for because there are LESS ways of doing
>things, you don't have to worry about so many 'tricks' and things like
>peephole optimisation so much. Having more registers is not necessarily
>better on a CISC architecure, it is better however for writing demos ;-)
>because you can spend 3 hours optimising a routine to get an extra register
>, cut down on memory access and hence get that spinning cube running 1fps
>extra !!
I think you've taken a deductive leap which may have lost some of us here. You've given an example of how a 68k compiler might not optimise poorly written code and taken this as proof that CISC is harder to optimise for.

Can you summarise what particular addressing modes the 68k has that make it so hard to optimise for, and what the x86 has that makes it easy to optimise for?

Btw, one fact I seem to remember hearing was that C code destined to be compiled on an x86 (and no doubt many other processors), can be optimised by defining the must used element of a structure as the first element. Does Watcom automatically rearrange structs for you to do this?

>-manic laughter

I've had compilers which would optimize for a 486 for nearly a year. They
have been available much longer than that. My VC++ for NT will optimize
for a Pentium - plus it makes code on a 486 run much faster. There may be
better architectures, but you ought to know more about what you are maniacally
laughing about. As far as I know every major compiler will optimize for
a 486 (MS, Watcom, Borland, Symantec).

:>Yes - very clever optimisation... Any C compiler can only do so much to
:>optimise poorly written code though. I wonder what the 68k compiler would
:>make of:
:> t = array [0];
:> array[0] = array[1];
:> array[1] = array[2];
:> array[2] = t;
:>

You are suggesting that when we write code we should have an idea of what
the compiler will produce, however for MOST users this is not the case,
you can use knowledge about the compiler to improve code, but this is
as 'bad' as assembler hacks to prove code speed.

:>>hence RISC is easier to optimise for because there are LESS ways of doing
:>>things, you don't have to worry about so many 'tricks' and things like
:>>peephole optimisation so much. Having more registers is not necessarily
:>>better on a CISC architecure, it is better however for writing demos ;-)

:>>, cut down on memory access and hence get that spinning cube running 1fps
:>>extra !!

:>I think you've taken a deductive leap which may have lost some of us here.
:>You've given an example of how a 68k compiler might not optimise poorly
:>written code and taken this as proof that CISC is harder to optimise for.
:>Can you summarise what particular addressing modes the 68k has that make it
:>so hard to optimise for, and what the x86 has that makes it easy to
:>optimise for?

Its one of those things which is hard to prove (like Church's thesis and
Turing machines), but it is something that from my experience seems to be
true. I think the key issue is addressing modes, the 80x86 has less modes
and hences less 'tricks' us humans can use to beat the compiler with.

A generic problem with compilers is the insistance on using stack based
variables, GCC makes some attempt to cure this with -fomit-frame-pointer.
Humans are better at register allocation IMO.
The 68000 has more registers and we are better at register allocation

and avoiding memory access (i.e. using 'SWAP' etc). The 68k is very
slow on memory access and so we can gain more from avoiding memory access.

:>Btw, one fact I seem to remember hearing was that C code destined to be
:>compiled on an x86 (and no doubt many other processors), can be optimised
:>by defining the must used element of a structure as the first element.
:>Does Watcom automatically rearrange structs for you to do this?

This would be sensible on CPUs where indexed addressing has an overhead,
I presume Watcom does this, I was very impressed by this compiler but it
still can't beat me, mainly because using stack frames and its 'uncunning'
register usage in some situations.

>If they are for expansion only then why include any memory AT ALL?

Please don't lie like that Gavan. NO ONE HAS EVER DENIED THE 1/0 FALCON!!
It has been stated from day one of the announced configs that 1/0 models would
be available for those who wish to do the upgrade themselves to 14 megs, rather
tan buy the 14 meg boards form Atari. That was the official Atari line since
the announcement.

> Seems to me its a ploy to sell more as they`ve seen how the A1200 sold

>months until I could afford a HD and more memory, and was able to do C and
>AMOS programming on it.

Had mothing to do with the Amiga. Give me a break. The reason it took time
for the 1/0 configs to show up is that there were not too many Falcons being
produced early on, and all of those were devoted to the 4/65 configs, since that
is the true base model. You are right about the "being able to upgrade later
when they can afford to" thing...` Same reaosn that there is memory in there
at all, so that it can be used minimally (No Falcon software will run,
guaranteed!) with older ST software.

I disagree. The standard GEM desktop (TOS 2.0+) is as powerful as I have
ever needed. I run no enhancers (or even replacement file selectors!)
on my systems. Name some specific things I can't do...

> I think its better to have a powerful, standard, compatible desktop
>than to have loads of seperate desktop add-ons. The features of the Amiga
>such as screen switching and AREXX make integrating file-managament type
>programs such as the excellent Directory Opus, very easy.

Ugh. Screen switching is one of my biggest gripes about the Amiga, and
is a complete turn off for me... It works for this UNIX text based interface,
but If I have a GUI, I don't want multiple screens!

> My only regret is that you need a VGA or Multisync to get the full

Same is true of the GEM desktop. Once you run in 800 x 600 + and have your
applications arranged neatly on the screen with plenty of room for windows,
there's no going back.

:> hmmm. I would have thought that there were 256*256 possible
:>combinations for any given pixel giving 65536 outcomes, each of which has
:>needs two bytes to decribe the chunky pixel. Of course, many of these will
:>be duplicates so you _might_ be able to get away with a half size table
:>making it only 64Kbytes in size. A friend of mine used a similar LUT
:>scheme to do digital noise reduction of old b&w films in hardware using an
:>EPROM.

The whole point of using the DSP is that is fast enough to calculate the
data that might have 'pre-calculated' on the 68030. *yawn* Obviously
gavan has no idea about the power of this dsp.

:>>ooppss you forgot about the sound dma, answer your question for you!
:>
:> No it doesnt. Even assuming the sound DMA isnt just hardwired to the
:>DACs to make the sound, it would only be able to fetch from memory to the
:>DSP, not help in sending any of the data back. How are you going to
:>syncronise all the data coming from the sound DMA and the host port? And
:>what about the additional access needed to make any updates to the
:>playfield held in the DSP? What about making sounds?

Gavans STUNNING knowledge of the Falcon shows through, the 'SOUND' dma
can be connected to any of the devices and you can do simultaneous 1mb/s
transfer both reading and writing giving a total 2mb/s. Please don't
doubt my knowledge of the Falcon , you only make a fool of yourself.
To do sound while using sound dma, you simple connect DSP OUT -> DAC,
again gavan's knowledge is stunningly bad, ever heard of the falcon
sound matrix?

[rubbish deleted]

:> The real limit isnt DSP processor power, but instead the rate at which
:>the CPU can do memory<->DSP xfers. Having quite a small amount of memory
:>in the DSP wont help when trying to do scrolling either. Theres going to
:>have to be a very repetitive scrolling background.

yes the dsp cannot utilise all its power in some case because of the
transfer problem, but careful programming gets around this in most
cases.

:>>actually for the 1600x600, mode I have it displaying 128x600 at the
:>>moment ;-). I always said this was theoretical, but 1600x600 in other

:>>modes have been acheived,
:> As I said above, I was talking about cutting the rez to make the `dual
:>playfield` effect you describe be physically possible, not talking about
:>your equally unfeasible 1600x600x65kcolour screen.

You have no idea about what the Falcon is capable of, your lack of
knowledge about of its DMA h/ware and things in general prove this. It
is *painfully* obvious that you lack hard facts.

> It going to end up with me proving something like `you can do 160x100
>in 14 FPS with 100% CPU contention` or some such similar spec.

more like 22-27, I think I am in a better position to estimate than someone
with your lack of knowledge and experience, why would I lie?

:> I`d still like to hear how many _BYTES_ of memory the DSP has, how wide
:>the `Host port` is and the memory and task management facilities of the OS
:>with regard to the DSP.

96KBYTES.
The OS provides functions for transfer over host and using sound dma for
all data types, byte, word,long etc, there are well over 50 functions...
(its funny how you have to ASK me about such stuff yet you argue with
me about implementation details - makes you look very silly IMO).

[stuff savagely killed, mutilated and fed to the great bit bucket in the sky.]
> Doesn't the ARM flush the pipeline in the event of a branch taken? If so, then
> the effect is similar to a BDS with a NOP inserted.

This is not a major headache to optimisation though. Because all branches
cause the pipeline to be flushed and 'cost' you three instruction cycles it
gets down to a simple "can I do this in less than three conditional
instructions?". If the answer is yes then you make the code conditional
otherwise you branch around it.

As I understand it where BDS has it's biggest headache for optimising is in
the choice of the instruction to be inserted after the branch instruction as the
compiler often has little idea of how often the loop is going to be performed.

Screenblaster and Blowup030 are NOT accelerators but resolution
enchancement programs (which blow away the standard Mac graphic cards :)

>High resolution - 2 bits deep. Try putting the sucker on 256 colors, single
>line and fall asleep while the menus pop down. Most 040 macs are running a

When running in 640x480x16bit collor this can get a little slow under MTOS
but even there the Falcon is still faster than an ST in screen updates.

>640*480*8 screen, rather than a 640*400*1 - thats more than 8 times the video
>throughput.
>
>Besides, there aint much that runs on Falcons except in ST high anyhow. OK,

What a bunch of crap. Games are the only real problem and even with told
games you get about %70 compatability.

>Works, but THAT is no killer app!
>
>Benjamin Keen
>
BULL! My Falcon desktop has a much faster feel to it in 640x480x256 than
any 68030 Mac (LCIII etc.). And this is without Warp9 or NVDI.

The MAC OS is *CRAP* and is much slower than TOS/MTOS. It is true that you
can get an 040 Mac that makes it bearable but in that case you had better
be comparing it to a TT/TTclone.

Total, 100%, unprocessed BULLSHIT. The PowerMacs will run both System 7
and Windows 3.1. In fact, modifications are made to System 7 so that the
Sys7 and Win3.1 clipboards are compatible. IE: when running Mac and Windows
apps at the same time, you can cut and paste text and graphics between the
Mac and Windows applications.

Further, the PowerMacs WILL be able to run Taligent, when it debuts
next year. Chances are Taligent will beat Commodore's next-generation
Amiga systems to the market.

>RandyH

Of course the PERCENTAGE of F030 owners owning a system with at least 4 megs and a HD will be higher than the corresponding percentage of A1200 owners. However, its not the percentage that counts when software companies are deciding to make software for a machine - its the NUMBERS of people who will make up their target market. Thats why you get software like PageStream 3 on the Amiga and not the ST. You cant run this on a base 2 meg chip only machine, but there are enough owners out there with HD and 4 megs+ to mean that the market is bigger on the Amiga than the Atari. In this case, things are not so clear cut since the program is not a specific AGA/F030 program but can run on any model with enough RAM and HD - so the vast number of ECS Amigas vs STs also help swing the numbers argument. The numbers argument also explains why you get so much modern PC software needing a 486/33 even though the percentage of all installed PCs with this config must still be relatively small - the market is still large enough to support it.

As for talking BASE configs - and in this sense I take it you consider that the 2 meg chip only A1200 is the BASE A1200 since it is the lowest config sold, then the BASE FALCON is only 1 meg, no HD. Not a lot of

useability in the base Falcon config either I think. Thats why most Falcon owners opt to spend extra and get 4 megs and a HD and thats why serious A1200 owners will buy an extra 4 megs fastRAM and a HD (and still pay a lot less than for a Falcon).

You can actually buy A1200s here in a 6 meg (2 chip/4 fast) 85 megs HD configuration from several suppliers. You can even buy a preconfigured A1200 with 50MHz 030 card and 4 megs fastRAM and HD from another supplier. You may well say "but how many Amiga buyers will opt for this config" but I say
"how many buyers will opt for a Falcon AT ALL".

Gavan.

If nobody has any complaints about this I will post a screenshot. It's 140k uuencoded, though, and I know that quite a few people who read this group have to pay for their newsfeeds, so large binaries aren't particularly appreciated.

If anyone wants it, though, I can mail it to them.

Ok, but the Amiga does it with 12 sectors, 80 tracks. If I use 82 tracks,
I would actually get around 990kB. And the Amiga could still read these
specially formatted Atari ST/Falcon disks, but it wouldn't work the other
way around (unless, of course, you used some external hardware).

>OK, I still use Devpac, but only because this is what I'm used to, and also I want macros and assemble to memory(without having to use RAM disk). If only someone would make a cross between Turbo and Devpac ;-)
>E.g Macros, PART system, Auto indent, assemble to memory, etc.
>

You still haven't figured out how to assemble to memory ?
Turbo Assembler can assemble to memory if you have at least 2 meg. First
you must have loaded the debugger. If you then assemble you get the option
to jump to the debugger. Choose it and the program will be passed to the
debugger and you can run the program.
If you get a out of memory error you must rearrange the memory
under the menu option information and then you must choose reorganisieren.
Change the free memory number in a bigger one.(I can't remember the
german text of it.)

One of the better parts of turbo ass is the debugger Bugaboo.
(I think it's much better than monst 2)
You must do strange things to crash it.

Does someone know what the latest version is of turbo ass.
My version is v1.7.6 but I heard that there is V1.7.7 ???

Greetings,

Robert. (robertde@htsa.aha.nl)

: the 'majority of A1200 owners on UseNet' have. Gavan you are so full of BS.
: This was certainly not how the arguement started. Now when it becomes apparent
: that you can not win the 'which base config is better' war, you change gears
: and start talking about a different base of users.

What's the big deal about a "base config war". I'd expect value for money.
What happened to Atari's moto, "Power without price", or is it "price
without power"?
"
: So how many typical consumers buying A1200s are going to have this 6/80 config???
: I still think a greater percentage of Falcon owners will have the 4/85 config
: compared to the percentage of A1200 owners that will have fast ram or any
: other enhancements.

Who gives a sh*t about percentages? Nearly all software developers are
interested in the size of the market. I could easily say all 32MB PC's
have 32MB's of ram. BFD.

My brother has 5mb on his A500, with 340mb hard-drive. I've got 500mb
of HD space on my PC, 150mb tape drive, etc. I've also got 240mb on
each of the five NCR 32/600 towers, and another 380mb of HD space on
my NCR 32/650 tower. Does this mean I win the base config war?
The 32/600's cost me about $100 each, kitted out. Of course the NCR's
are so elderly, running Sys V, r3, that I can't really get any software
off-the-shelf and have to a bit of home-brew compiling now..

I'd bet there are more expanded Amiga 1200's than Falcons. The combined
A4000/30, A4000/40 and A1200 market would be an order of magnitude larger
than the Falcon market.s.

I would reckon there are more 68030 expanded Amiga 1200's than Falcons.
I would believe there are more Atari machines with DSP's than Atari 1200's.
I would believe there are more PC owners with DSP's than the combined
Amiga 1200 and Falcon user base..

: Ugh. Screen switching is one of my biggest gripes about the Amiga, and
: is a complete turn off for me... It works for this UNIX text based interface,
: but If I have a GUI, I don't want multiple screens!

: Same is true of the GEM desktop. Once you run in 800 x 600 + and have your
: applications arranged neatly on the screen with plenty of room for windows,
: there's no going back.

Eeek, 800x600 is barely adequate if you ask me.

I run 1024x768x8bpp and still want screens. There's not enough memory
for the colour depths I want, and my ATI Graphics Ultra Pro doesn't have
enough zings/Xstones/whatever to push pixels quick enough for my liking
at 800x600x24bpp. I'd used 1280x1024 if my monitor could do it NI.

My desktop get sluggish at 24bpp, 16bpp is okay, but I much prefer 8bpp.
I prefer screens, as I don't want my monochrome DOS apps running on a
24bpp screen. I also hate having to shutdown and bring back Windows
to change resolutions and colour depths.

Well Randy, the problem too is some Falcon owners DISREGARD the $$$PRICE$$$
difference between the two machines. Hey, a base Cray-II surely kicks butt,
doesn't it.... but it has a very steep price.

In the case of the A1200, the myth about the user base being 2 megs chip
and therefore no serious software development, is just that: a myth.
I think this is what Gavan is trying to point out too.

If a machine costs 2.5 times the other one (base configs), it'd better
be better.

|> So how many typical consumers buying A1200s are going to have this 6/80 config???

Maybe, but in terms of number of machines out there which counts, the A1200
numbers are bigger.

As I stated in a reply to this a couple of messages ago, this is
nonsense ! The Falcon is fast (and certainly has faster video than an
A1200 and standard 68030 macs). The biggest problem is with people do not
know how to use Multitos correctly because Atari decided not to provide
any real documentation. Once you set the system parameters corectly you
can't really see the difference between TOS and MTOS as far as speed is
concerned.

There is 32MB/s video bandwidth available in the Falcon.

Yea, the Atari OS is crap!!! A 040 Quadra is much cheaper than any TT and Falcon. A $1200 falcon is ludicrous!!!!

System 7 has alot more features than your crappy Atari OS. Atari's OS is an excuse for an OS. You know that you lost! No one is buying Atari anymore!!!

No big deal at all, but that's what the discussion was about and I was trying to point out that when things didn't go his way, Gavan changed gears and started arguing about something entirely different.

So what did happen to "Power without the Price?". I don't know as I have not seen that used as a motto in some time. Are you trying to suggest that it still is their motto? I would guess it is not so why do you bring it up.

|> "

I don't know if anyone gives a sh*t about percentages, but again the debate was over what developers would consider the base config and therefore what 'level' of software would be developed for each machine.

|>
|> My brother has 5mb on his A500, with 340mb hard-drive. I've got 500mb

|>
|>
|> - Jim

All this is well and good, but it has nothing to do with the original debate. Please pay attention before trying to change gears like Gavan. I certainly do not doubt that there are more expanded A1200's than Falcons, but the point was that within the Amiga market there are more non-expanded A1200's than expanded ones and therefore developers are going to develop software that can be used by the biggest market possible and that software will not be as capable as if the base config was better.

Don't you realize that we on the net represent a small percentage of real users out there and in general our access to the net means we are more affluent and therefore have more of the add-ons and enhancements that the typical user just doesn't need. (Preparing for lots-o-flames on this one)

:)

While the Jaguar got a couple of awards... I kind of wonder... I mean,
how come Tempest 2000 can get an award? It's like giving an award
to Space Invaders.

Alien vs. Predator is the type of game I would expect to get an
award, not TEMPEST XXXXX.

So I wonder how reputable where the sources who gave the award
at least for the 'best game.'

|>
|> C'mon guys, let's see really who can code now ....

True ;-)

Well, there's no comp.sys.atari.programmer (perhaps time to propose one?), but let's say that this is what I figured out for texture mapping:

Assumptions:

1. I assume you know/have the algorithm for drawing polygons
2. I am not 100% sure if this would work, but goes along with Giff's brief indication that texture mapping is 'faked.'

Ok, suppose you have texture A:

```
AAAAAAAAAA
AAAABBBBBB
AAABBBBBBB
AABBBBBBBB
ABBBBBBBBB
```

And let's suppose you have the following polygon to fill:

```
***
* ***
* ***
* * <- Wall
* *
* ***
* ***
***
```

Okay, let's also assume we have a '3D Wolfstein' type game- you can move your view angle sideways but not up and down (just to simplyfy a couple of things for now).

Now, when you are drawing the polygon, you draw it like 'scanning' it from left to the right, horizontally. That means that you draw each vertical column from the left to the right.

You calculate the distance in the y axis between the highest point
in the column you are currently drawing and the lowest point in the
y axis in that same column.

Now, make a scale factor for that column, which is given by:

sizeOfTextureMap / distanceInY

Using this scale, you now start drawing the column, ploting
texture points in the following manner:

(actually, here's what would be the algorithm)

```
x,y - cursor position in polygon
dy - distance in the column
dx - distance in the row (I added this now)
scaleY - calculated scale in the Y axis
scaleX - calculated scale in the X axis
sizeX, sizeY - size of texture map in X axis / Y axis
xm,ym - cursor position in texture map

dx= leftmostPos - rightMostPos
scaleX= sizeX / dx
xm=0 - point to first column in the texture map
for x=leftColumn to rightColumn
dy= highestPoint - lowestPoint
scale = size / dy
ym=0
for y=highestPoint to lowestPoint
plot in (x,y) color of (xm,ym)
ym=ym+scaleY
endfor
xm=xm+scaleX
endfor
```

The thing is that the point you are plotting to fill the polygon is
being read from the texture, and since there's a scale associated
with the 'movement' of the 'texture cursor', you actually are scaling
at the same time the texture to fit the polygon.

This is for a polygon of Wolfstein 3D type walls... you'll have
to do a dynamic calculation of scaleX for each row.... I think that
would do it...

Like I said, I am not sure, but makes sense.... ;-)

>
>sorry for the confusion, the change in PC I was referring to is if you
>add or subtract to the PC (r15)...
Now, spot who's being silly...
Chris is saying that the pipeline is flushed then a branch is TAKEN, which occurs when a branch instruction is executed with a condition which evaluates to true, and will result in a change of PC. Griff's statement that a false condition _may_ not result in a change of PC, and his referrence to the STR instruction, are probably totally perplexing anyone who knows anything about the ARM (except maybe Griff himself). So, to restart from scratch:

The ARM WILL flush the pipeline if the pipeline is invalid: ie. the PC has done something other than increase to the following instruction. To understand how this happens, two facts need to be known about the ARM -
1. All instructions are executed conditionally, not just branches. The 'normal' condition used by instructions is AL - always. Before executing the instruction, the condition is checked. No action is performed if the condition is false (but one clock cycle is used)

2. The PC is register 15, and can be written to as a normal register - although it won't behave as a normal register: mainly, writing to it causes pipeline flushes. It can also be updated by either of the branch instructions.

So, there is nothing special about branch instructions in relation to flushing, nothing AT ALL special about conditions, whether in relation to branches or STR instructions.
Oh, and there isn't a NOP instruction :-) :-)
(What's the world coming to when you need to put 2 smileys on a sentence to stop people flaming you...)

What? You're both wrong. The 80x86 series has the Intel 8080 as it's
ancestor and base, not the Z80. The Z80 was also based upon the 8080,
but it has some architectural enhancements that made it a *much* more powerful
processor. None of these processors was ever designed for controlling
washing machines. The idea of using microprocessors to control appliances
came later. The 8008 was originally designed to be the brains in a smart
terminal (Datapoint). The 4004 before it was designed to for hand held
calculators.

Of course, I used to deal with demographics, income distributions, educational
attainment every day. Just look at the market place and see what's offered.
Even though the Falcon has a higher base config than the A1200, you're
ignoring the fact there are lots of other Amiga models being sold and the
market is probably an order of magnitude larger than the falcon.
Then again, the PC market is about two orders of magnitude larger than
Amiga.

System 7/Mac features:
- Must go through several layers of BS protocols to do the
simplest of functions.
- Can end up resetting becuase it looses track of floppies (has happened to me
several times - "Pleas insert disk x" IT'S IN THERE YOU STUPID *&^*&!!!).
- Can catch catnaps while applications are loading.
- Files are not easily interchangeable between applications due to header.
- A Mac bought 7 years ago is not usable (with System 7). An ST can usably run
MultiTOS. No need to worry about your Mac breaking down. You
have to buy a new one every couple of years anyway.
- You get to buy those special printers that cost nearly twice what they cost
for any other system (I can pick up a laser printer for my ST for
under $500 - I've yet to see a Mac printer for anything close to
that).
- The simple one button mouse. Don't want to get owners too confused
(no, no, your other left).
- The blazing redraw speed.
- The irritatingly slow disk access (what IS it doing when you put
the floppy in?).
- Any other System 7/Mac features I missed?

The Falcon with NVDI redraws 256 colour high res screens lots faster than the 1200. Seeing is believing, I have seen both. I saw a MAC with a 40mhz 030 and it was so slooow, just watch those pull-down menus draw....

In article <1994Mar4.203105.25902@rmece02.upr.clu.edu> raist@rmece02.upr.clu.edu (Ricardo Hernandez) writes:
:> Well, there's no comp.sys.atari.programmer (perhaps time to propose
:>one?), but let's say that this is what I figured out for texture mapping:
:>
:> Assumptions:
:>
:> 1. I assume you know/have the algorithm for drawing polygons
:> 2. I am not 100% sure if this would work, but goes along with
:> Griff's brief indication that texture mapping is 'faked.'
:> Ok, suppose you have texture A:
:>
:> AAAAAAAAAA
:> AAAABBBBBB
:> AAABBBBBBB
:> AABBBBBBBB
:> ABBBBBBBBB
:>
:> And let's suppose you have the following polygon to fill:
:>
:> ***
:> * ***
:> * ***
:> * * <- Wall
:> * *
:> * ***
:> * ***
:> ***
:> Okay, let's also assume we have a '3D Wolfstein' type game- you can
:>move your view angle sideways but not up and down (just to simplyfy
:>a couple of things for now).

Yes this simplifies it ONE HELL OF A LOT, it means you take what is a multi-variant interpolation problem and convert it one which requires only a single interpolation accross each scanline.

:> Now, when you are drawing the polygon, you draw it like 'scanning'
:>it from left to the right, horizontally. That means that you draw
:>each vertical column from the left to the right.

I think you are trying to see, that you start from the top of the polygon and for each-horizontal line you calculate the left and right x-co-ordinate, (you can also map the appropriate point on the 'texture' to the edge.)

```
:> You calculate the distance in the y axis between the highest point
:>in the column you are currently drawing and the lowest point in the
:>y axis in that same column.
:>
:> Now, make a scale factor for that column, which is given by:
:>
:> sizeOfTextureMap / distanceInY
:>
:> Using this scale, you now start drawing the column, ploting
:>texture points in the following manner:
```

Drawing Columns is bad idea, you want to scan-converting horizontally
on a falcon, HOWEVER on MODE-X on the PC it is better to do it in
columns, with bitplanes it is also better to do it horizontally,
(but there are large overheads for masks and suchlike - hence killing
the 'plotting' argument that was going on here a while back).

```
:>(actually, here's what would be the algorithm)
:> x,y - cursor position in polygon
:> dy - distance in the column
:> dx - distance in the row (I added this now)
:> scaleY - calculated scale in the Y axis
:> scaleX - calculated scale in the X axis
:> sizeX, sizeY - size of texture map in X axis / Y axis
:> xm,ym - cursor position in texture map
:>
:> dx= leftmostPos - rightMostPos
:> scaleX= sizeX / dx
:> xm=0 - point to first column in the texture map
:> for x=leftColumn to rightColumn
:> dy= highestPoint - lowestPoint
:> scale = size / dy
:> ym=0
:> for y=highestPoint to lowestPoint
:> plot in (x,y) color of (xm,ym)
:> ym=ym+scaleY
:> endfor
:> xm=xm+scaleX
:> endfor
:>
:> The thing is that the point you are plotting to fill the polygon is
:>being read from the texture, and since there's a scale associated
:>with the 'movement' of the 'texture cursor', you actually are scaling
:>at the same time the texture to fit the polygon.
```

This is conceptually correct, you could have put it more simply like
'you are squashing each vertical column onto its respective destination
column on the screen'.

'Texture mapping' where the textures are required to rotate in not
just one direction require double interpolation along the texture,
this can be likened to taking a LINE (not a vertical line) and squashing

this line onto the horizontal line in the destination polygon... its
quite a headache to code, since the direction of the lines is important,
and you need to decide what 'end' of the line to map from etc.

:> This is for a polygon of Wolfstein 3D type walls... you'll have
:>to do a dynamic calculation of scaleX for each row.... I think that
:>would do it...

wolf-type 3d type loop for the falcon is

```
;d0 = fraction.w/integer.w (scale factor)
;d1 = current frac/integer (offset into texture)
;d2 = no. of pixels in hline (DX)
;a0 -> texture
;a1 -> screen hline.

.pixel_lp
addx.l d0,d1
move.w (a0,d1*2),(a1)+
dbf d2,.pixel_lp
```

(unroll the loop to increase the speed)

So you can see what chunky pixels are so nice, pc games tend to have
pre-generated code with the scale factors 'hard-wired into the code', so
it is only one or two instructions per pixel, and on a 486 this is will
be VERY VERY fast.

In a previous article, whitema@rtsg.mot.com (Michael A. White) says:

>
>Pray tell us, what are these settings (not an advocacy post, I do wish
>to know).
>
>Michael
>whitema@rtsg.mot.com
>

Well this is basically all I know of as far as speeding up the response under MTOS goes.

First of all you need the PS CPX module. This will let you set the priorities for all the programs in memory. The lower the priority for the AES is the better the response is. As far as applications go you can adjust that to so that you can run a lot of programs and still have decent response time on your main application. Set your 3 or 4 backgrount task to a low priority relative to your important programs which you switch between in the foreground and all of a sudden MTOS becomes really usefull!

The second thing you can change is the MINT.CNF file
the line SLICES=<some number> determines how much time is given to each process before going to the next one.

There is also a variable you can set that will use Hardware scrolling to speed up the text output by as much as %300. I have not figured out how to enable it yet. Does anyone else know how to do this?

You can also assing different utilities for desktop functions so tha when you double click on a text file you favourite text editor will be used instead of the VIEWER.APP. The same goes for the copy and format functions on the desktop.

In your GEM.CNF file changes these lines:

setenv ShSHOW=c:\MULTITOS\VIEWER.APP
setenv DESKCOPY=C:\MULTITOS\COPY.PRG
setenv DESKFMT=C:\MULTITOS\FMT.PRG

there are also many other variables which I do not know what to do with yet.

There are also keyboard commands for certain functions:

Control+Alternate+Tab switches between programs
Control+Alt+\ kills a process (this should be avoided if possible. use SIGTERM from the PS.CPX or delete the process from u:\proc\ )

Control+alt+z suspends a process
Control+alt+Fkeys does a great many things I can't recall at the moment.

There are propably more so please share the information. Nothing is too trivial!

It would be nice if someone from the c.s.a.s.tech group took some time to educate some of the less knowledgable.

> Funny that, watcom c 9.5 has options to optimise for each architecture including
> the pentium.

Yes, I vaguely remember Borland C 1.5 or 2 had a -386 option (this is a little under 3 years ago). A good marketing ploy but it didn't actually do anything. At one stage the only thing -286 did was use a special instruction for function entry/exit. But maybe that's Borland, and all the others except watcom. I don't doubt that watcom have spent 15 man years working on 586 optimisation, I'm just doubtful how far they got.

And of course there is the other little problem. Because you have to 'optimise for the 586' to get the stated speed increases, you effectively have to produce a separate version for it, since you can't limit your market to the 12 people prepared to pay $1000 for a processor. Hang on, what happened backwards compatibility. The worst of all worlds...

Or get PSControl 2.0, an app recently uploaded to the various archives. It's simply the neatest looking process controller I've seen. It knows about iconifying for those who have AES 4.1 too.

>There are also keyboard commands for certain functions:

>Control+Alt+\ kills a process (this should be avoided if possible. use

From what I gather the Atari Jaguar is infact a Konix multisystem
which also includes a computer called a FLARE. I could be wrong however.

All of these machines were incidently designed in britain! Makes
a change.

That may be true in your part of the world. In the US, PCs do rule, except in academia. It's really an easy equation 1 PC = < $2000 US. 1 workstation = 3-4x1PC. Plus software is cheap for PC and 10x as expensive for workstation.

What would be nice is: workstation power, PC software availability and price.

Mac users use harddrives as a primary storage. Oh I forgot Atari users are
still on floppy!!!

> - Any other System 7/Mac features I missed?

040 Macs for under a grand!!!

Atari OS Features:

-It's crap

- no file sharing

-no publish and subscribe

-no aliases

-can't run Mac software

-Atari has one OS developer

-Atari has lousy warranty policies. Wait years for repairs.

-no 040 ST's

Atari Corp is a bad excuse for a corp.

Did I miss anything??

: :>>Who cares about pre-rendered graphics?
: :>
: :> Well, anyone wanting to do multimedia, animations, slideshows,
: :>ray-tracing for starters.

: multimedia = mpeg/jpeg/real-time gfx/sound. Sounds like Falcon to me :-)
: raytracing = render in 24bit, then convert to HAM8, or TRUE Colour, which
: conversion is easier ;-).

Name one multimedia package that uses jpegs for images. They're nearly
all stored as uncompressed images on CD-Roms, which allows for much
quicker display speed.

Why not ray-trace and display in 24bits? Why the clunky 24-> 16bit
conversions. Most new PC's nowadays don't need this hack.

: I expect the Amiga gfx used in the ITV chart show are in HAM8 (laugh) ;-).

Well, if I see Falcons being used to render shows like Seaquest, Babylon 5,
etc, I'd be more impressed. The joke's on the Falcon owner who sink money
into their machine, expecting it's going to storm the desktop video scene.
I'd expect the SGI Indy's, Amiga's, Macs and even PC's to do a better
job at desktop video and have better software.

: recalculation (or blitting of recalculated sections) would be required.
: Can't these Amiga heads get it into their heads that HAM8 is not FASTER,
: it is not a question of BANDWIDTH, HAM8 is a lot of agro if you ask me.

Does the Falcon support double buffered displays yet?

: Actually Gavan I was working on 1600x600 util for the Falcon, but Uni-work
: is taking precedence - yes that 1600x600 in 65536 colours, I got 800x600
: working, and the screen didn't seem to lockup when I switched pixel
: clocks to allow 1600x600, so don't harp on about HAM8.

What refresh rates are you running at and what monitor are you using?
You're not using a TV are you?

You definitely will want to do it vertically. If you draw horizontally
you lose a lot of optimization opportunities, unless you're doing a
texture mapping engine for arbitrary surfaces, where horizontal scanning
is preferred (caches work better, and the core loop can be simplified)..

Yes you are.

Flare is the company in the UK that designed most of the Jaguar.
They also did the Konix games console a few years ago. It was never released,
and has nothing to do with the Jaguar (technicaly).

24-> 16BIT conversion is far less 'clunky' than conversion to HAM8, don't write such crap please.

>: I expect the Amiga gfx used in the ITV chart show are in HAM8 (laugh) ;-).

[stuff deleted]

>Does the Falcon support double buffered displays yet?

Your sweeping statements about the Falcon amaze me when you don't even know ANYTHING about the machine, of course it supports double buffered displays, the ST did back in 1985.

>What refresh rates are you running at and what monitor are you using?
>You're not using a TV are you?

You just harked on about multi-media stuff and the Amiga being using for Seaquest etc, then you contradict yourself by slagging down the Falcons capabilities on a TV. 800x600 16 bit true colour beats HAM8 on a TV anyday.

>- Jim

yawn your life 'Jim' but not as we know it.

In article <1994Mar6.001200.23955@cobra.uni.edu>, sinclap2954@cobra.uni.edu writes:
} > - You get to buy those special printers that cost nearly twice what they cost
} > for any other system (I can pick up a laser printer for my ST for
} > under $500 - I've yet to see a Mac printer for anything close to
} > that).
}
} What printer is that. I can get a Postscript Apple Laser for about $500.

Now this is seriously impressive, Peter, since the license for PS is
going to cost more than that!

} No need for two. I actualy have two on my Duo.
} > - The blazing redraw speed.
}
} I suppose when you have less powerful programs, you get faster redraw screens.

That's not the issue, the issue is the painfully slow redraw of the
simplest of windows (eg: one with some text in it + a few line
drawings...)

}
} Mac users use harddrives as a primary storage. Oh I forgot Atari users are
} still on floppy!!!

Peter, Peter, it's a symptom of an inefficient disk subsystem. I'll
grant you that the HD's are faster than the floppies. No argument
there, they're definately faster.

} 040 Macs for under a grand!!!
This is one argument you win. Atari have no machine for under 1000
c/w an '040.

}
} Atari OS Features:
}
} -It's crap
nope.
}
} - no file sharing
What does this mean ? The same file can be open for read/writing for
several processes under MiNT, if that's what you mean.
}
} -no publish and subscribe
True. This is supposed to be in MultiTOS, but I've not heard much
about it, perhaps a developer could comment.

}
} -no aliases
Bullsh*t. At the gui level, many desktops have 'aliases', which are
just multiple references to the same file, after all. At the most
basic level, the Os has "links" (the unix variety) which offer the
same functions.

} -can't run Mac software
Don't make me laugh. The ST range has a far better chance of running
Mac software (with extra hardware) than the Mac has of running Atari
software. I can in fact claim that one of the major problems of Macs
is that they can;t run Atari software, but since that's a ridiculous
thing to say (if you want to run atari software, buy an atari. Ditto
for Macs) I won't.

} -Atari has one OS developer
BullSh*t.
Atari (and this is important, so read carefully) GIVES THE SOURCE FOR
IT'S OS INTO THE PUBLIC DOMAIN. There's a large number of people
suggesting additions, supplying patches, and testing etc. Atari has
a massive advantage over the Mac here. If you want to get it, ftp to
atari.archive.umich.edu:/atari/Mint and get the mint108s.zoo or
whatever the latest version number is.

} -Atari has lousy warranty policies. Wait years for repairs.
Bullsh*t. At least in the UK, Atari's service has been exemplary when
I've had problems. Turnaround for my faulty DMA chip was 6 days (and
that's day of posting to day of delivery. Each direction is 2 days)

} -no 040 ST's
Unless you buy 3rd party boards, no. There are 3 '040 boards I know of
for the Falcon.

}
} Atari Corp is a bad excuse for a corp.
Apple corp is a bad excuse for a corp. Come up with something better.

Apple must be the only company with an os that needs a processor the
power of yesteryear's mainframes just to run! PowerMacs indeed!

So what? I can get the slowest Power PC Mac for $2000 with monitor and
Keyboard that exceeds the performance of the $3000 Pentium. Here is a repost
of preliminary Power PC Mac prices..

MAIL>

NEWMAIL
PowerPC prices

Price
Model Configuration range

6100 8/160 $1,725-$1,775
8/250 w/CD $2,200-$2,250
16/250 w/SoftWindows $2,400-$2,450
8/250 w/CD and AV board $2,500-$2,550

7100 8/250 $2,825-$2,875
8/250 w/CD $3,025-$3,075
16/250 w/SoftWindows $3,225-$3,275
8/500 w/CD and AV board $3,825-$3,875

8100 8/250 $4,050-$4,100
8/250 w/CD $4,250-$4,300
16/500 w/SoftWindows $5,200-$5,250
16/500 w/CD, AV board $5,350-$5,400

Price does not include monitor and Keyboard.

Very funny... you mean your $2000 PowerPC Mac comes with 24-bit video,
separate video ram, resolutions above 824 x 632 or whatever the Apple
16-inch resoulution is, and a 500 meg plus hard drive? If so, you're
certainly not buying at the prices listed below.

The only time I would ever do Tmapping in vertical columns would be in MODE-X on the PC because of the overhead for setting the latch for what pixel to write to (in groups of 4). For bitplanes and chunky pixels it is better (IMO) to do it horizontally. Tmapping vertically using bitplanes would meaning using indexed addressing and 'plotting' each pixel into every plane for the whole polygon. Scan converting horizontally you can build the pixel data in registers and thus avoid the overhead and bitplane modes. I can post a VERY fast gouraud routine which uses this technique, it is probably as fast as can be acheived for bitplane type screens.

```
== TOP TEN REASONS TO STILL CHOOSE AN ATARI OVER A MAC ==

10) Just one model in production (Falcon) makes selection a 'no-
brainer.'
9) Tramiel's multimedia computer development in a 'class by itself.'
8) Still sports the largest collection of 'masochistic' programmers.
7) Less time wasted reading thick, glossy monthly periodicals.
6) No portability 'problems' due to no portable notebooks or laptops.
5) Extensive collection of 'two' games available for the amazing
Falcon.
4) Limit of one dealer per metropolitan area promotes close friend-
ships.
3) One-piece design featuring 'mushy' keyboard way ahead of it's
time.
2) Ergonomically-placed joystick ports good practice for fumbling &
cursing.
1) Who really needs all those CD-ROMs anyway?

TOP 10 REASOMS TO BUY A MAC
---------------------------
10 - words like CDEV, INIT and FPU are lots easier to learn than
DOS, DEL, and INTEL
9 - the local computer store has fewer shelves of Mac computers
making buying decisions easier
8 - you haven't lived until you see an Application not Found error
7 - where else can you buy a Centris and end up with a Quadra?
6 - Jack and his sons don't do Mac
5 - Windoze 4.0 will break more programs than System 7.0
4 - Macs aren't just user friendly, with added sounds, wallpapers,
and startup screens, they are down right cuddly.
3 - Microsoft does its experimenting on that other computer, leaving
us safe a while longer
2 - Sim City 2000 is awesome!
1 - Swampy don't hug IBMers

The very first time I used a supposedly simple to use Mac I got the disk stuck
in the drive. How stupid no fuck*ng eject disk button! After finding a command
to do the same job it comes half way out and decides to stop. Even the bent
paper clip in the hole did not cure the problem. The solution was to dismantle
the case to get a disk out.

I bought an 80Mb hard disk three years ago. It is still not half full and I use it everyday for serious work. A friend of mine bought a Mac with a 40Mb hard disk. Half a year later he bought an 80Mb disk to add to his 40.

I wish everyone would stop saying my computer is better than your computer. I have used ST, BBC, PC, Amiga, Mac, VAX and DECstation computers with a variety of different operating systems. I would not say one was the best. Everyone of the aforementioned machines have their good points and their bad points.

It is not up to some ignorant end user to tell other users that thier computer is rubbish. What they really mean is that the computer is no good for their own needs, NOT no good for every user's needs.

>Do you think they worked with pre-rendered TEST-MODELS then? (Ofcourse
not,
>they used the fastest wire-vektor or <whatever> to SEE THE RESULTS before
>doing
>the final rendering!)

YOU were claiming that animations were all done in real time, and that NO-ONE used frame-by-frame pre-rendered anims. Doing a simple wire graphics preview is not the same as doing the finished graphics. The sort of graphics a f030 can do real time are nothing close to what is needed for even the lowest grade of film or tv computer modelling. The same goes for ALL currently available PC technology. Frame by frame rendering is the way it goes.

>A machine capable of real-time <whatever> is better suited for
>multimedia/animations/<whatever>

If it could do real-time 24-bit raytraced gfx, yes. As it is, the best machine for doing computer gfx animation is the one which gives the most colours at the highest resolutions. Speedy rendering of the frames is a plus too.

>RH> Not even the SGI machines use their graphic cards for high quality
>RH> 3d animation...

>Que?

>If real-time wasn't important, how come people develope faster
>machines/software all the time?

Real time has to be the ultimate goal. The faster your machine the less $$$ you spend making your gfx. For the quality of gfx needed for TV/Film work, the F030 is SLOWER than an A1200 with fastRAM and FPU - not that you would be using either of these machines to do the rendering. Most likely a Pentium/A4000/Mac Quadra or if you have the Dosh, an SGI workstation.

>RH> |> True, but sales are going upwards.
>RH> Just like the A1200 and CD-32.

>CD-32, what's that? (It's not anywhere to be found HERE)

Falcon, Jaguar? What are those? Theyre certainly not to be found in the UK or Ireland. The Jaguar release date here has been put back to the middle of the year (it was to be 15th March) and the Falcon is nowhere to be seen in any high street retail outlet. Even mail order suppliers are thin on the ground.

I can however walk into Dixons or Rumblows and buy an A1200 or CD32. Some stores even stock A4000s. Whats better, ALL the software shops still sell Amiga software - you have a hard time even finding an ST software retailer, never mind one with more than about 6 games (maybe there arent actually more than 6 games for the machine?)

You see, you atari owners fouled your own nest with piracy. There were around 600000 STs sold in the UK, compared with 1.5 Million (maybe closer to 2 million now?) Amigas. Thats still a reasonable market, yet Atari software sales are on a par with C64 sales!!!!! (1-2 % of the market) whilst Amiga sales are up there with Sega (23-24%). Why? because all the stupid Atari owners killed the software support for their machine by widespread piracy. And they have the cheek to call Amiga owners pirates!

For
>GM> the price of 4 meg f030 with HD wou can get an
>A1200/6megs/HD/SCSI/25Mhz
>GM> 882 unit which I think is very competitive.

>This part says that you can get A1200/6Mb RAM/HD (size?)/SCSI/25Mhz 68882
>for
>the SAME price.

>...and yet you forgot to tell me WHERE!

OK. Silica Shop sell the GVP SCSI/RAM board with a config of 4 megs
fast/25 Mhz 882 and SCSI port for 350UKP. You can pick up an A1200 mail
order for around 270UKP (its 290UKP in high street retailers) and an 80
meg IDE HD (2.5" for internal fitting) costs ~170UKP mail order.

Total 790 UKP compared with 800UKP for 4/65 Falcon. You might be able
to get the A1200 and HD even cheaper. I`ve seen prices as low as 260 on
the A1200 and 150 for the HD, but the firms looked a bit dodgy. I`m
quoting reputable suppliers. having said that, I bought my HD from a PC
end-of-line boxshifter for 155 UKP and it worked ok...

AmigaVision
>kicks *SERIOUS* butt ;-)

Yes. The real problem with AmigaVision is the lack of on going
support. Scala and MediaPoint etc seem to get regular updates, but C= are
typically sitting on AmigaVision and doing nothing. I think another
problem is the lack of seperate player software, meaning you have to run
the full system just to view a presentation. This eats memory and leads to
copyright problems. Still, with such a large choice of MM software, this
is no great problem.

Gavan.

>are available for the A1200?

> There is a *VAST* variety to choose from....

Too right! There are dozens of RAM/FPU boards to choose from, some use ZIPS, but many use the more standard SIMMS. Some offer SCSI/SCSI-II as well. Not to mention the 030 cards - Microbotics, GVP, ICD, and CSA all make 030 cards ranging from 33 MHz up to 50MHz. You can get practically ANY combination of 030/memory off the shelf and even nicer are the combined 030/SCSI-II cards. Prices are good too, I see 030/40Mhz cards going for as little as 250UKP - that means you could build an A1200/030 40Mhz/4 meg fastRAM/80 meg HD for around 850UKP with clever shopping around. I see INDI are selling 50MHZ systems for only 870 UKP!

You can easily build a more powerful A1200 system than ANY Falcon system, or an equivlent system for a lot less money. The only thing missing is an 040 card for the A1200, but since you can buy an out of the box Amiga 040 thats not much of a drawback. You`ll probably want the expansion capability of an A4000 if you really NEED an 040

only >for
>explansion...) ..

Ha Ha! YOU claimed over the summer that the Falcon was ONLY available
with 4 meg minimum. So did a couple of other people, but your claims are
always ridiculous so I tend to remember them more. There have also been
posts in recent weeks from people claiming such a config isnt avaible in
their countries. I said intially that if you insist on calling the A1200/2
meg chip only the BASE machine, then you must accept that the F030 1
meg/floppy is also the Falcon BASE machine. I`ve always been consistent
with this line. I say compare like priced machines (thats actually unfair
to the Amiga since you can get a 6/85 A1200 for 200 UKP LESS than a 4/65
F030).

>>YOU however has claimed that people buy them and use them as such, thus
>>being
>>the low-level machine ... a statement you have NOT been able to back up.
>>AS
>>USUAL.

No, I started pointing out that you can get a 1 Mb Falcon simply to
show how unfair it was to always compare the 4/65 to the 2chip/floppy
A1200 config. I`ve NEVER ONCE CLAIMED that F030 software was written to
run in 1 megabyte off floppy. I`ve made no statements about Falcon
software, other than to say that theres not a lot of it and that it doesnt
tend to make use of the Falcons facilities such as the DSP, and thats
hardly a radical statement. I just point out that just as the A1200 sells
with a minimum config of 2 meg chip/floppy, so too does the Falcon sell
with a minimum config of 1 meg/floppy. I`ve also pointed out that since
you have to shell out extra money for the 4/65 config over the min config,
then you must compare this to an A1200 which has been expanded over the
min config.

I did say that some users will run a F030 in the min config, and I
stand by that. I also said that there are MORE A1200s with fastRAM and HDs
than there are Falcons , and I stand by that too.

Gavan.

|> Selling point. Apple has a marketing Dept. that actualy finds out what the
|> user wants. These nit picky things areone of them. Than again that Mac sales
|> has squashed ATARI!!!
If Apple have a marketing dept, how come they got the Newton so totally wrong?

Apart from anything else, yes, Apple do sell a lot. They don't make much profit though, do they Peter? They are also much more expensive outside the US and most of the software is overpriced. I use Macs sometimes at work and am very underwhelmed by them.

|> If you have an Ataridealer to performthe upgrade!! At least we have the option
|> to do so, unlike one computer company.
I have a wide choice of Atari dealers myself. I have lots of nice software that does what I want. I have great graphics & sound. I'm also awaiting updates of much of my software that is still being regularly updated.

|> > - The blazing redraw speed.
|> I suppose when you have less powerful programs, you get faster redraw screens.
What an inspired answer. Not. A German mag a while back compared state of the art Mac and Atari software in the graphics/retouching dept and guess what, the Atari software came out top!

|> Mac users use harddrives as a primary storage. Oh I forgot Atari users are
|> still on floppy!!!
I know many, many ST owners, 2 PC owners and no Mac owners. Oh yes, an Archimedes owner. All the St owners bar 1 have HDs. I've got 65Mb internal and 400Mb external

|> 040 Macs for under a grand!!!
Not here.

|> Atari OS Features:
|> -It's crap
Have you looked at MiNT AKA MTOS? I don't think you have.

|> - no file sharing
MTOS has file locking in the same way as Unix. Exactly like Unix when you have a Minix partition.

|> -no publish and subscribe
What's that?

|> -no aliases
Is this like a softlink to a file? We have that under MTOS.

|> -can't run Mac software
Mac GCR runs Mac software.

|> -Atari has one OS developer
MiNT, Minix, Magix, Mirage, BSD (no longer supported), and several more.
BSD 386 and Linux are in theprocess of being ported.

|> -Atari has lousy warranty policies. Wait years for repairs.
My MSTe broke. I sent it back. It was returned 5 days later. Sounds reasonable to me.

|> Atari Corp is a bad excuse for a corp.
It's a fair cop :-)

|> Did I miss anything??
Yes, you forgot to fuck off and die.

|> >>
|> >>excuse for an OS. You know that you lost! No one is buying Atari anymore!!!
That must be why there is a backlog in the UK of 5000 STes on order.

|>
|> 10) Just one model in production (Falcon) makes selection a 'no-
|> brainer.'
Or a TT.

|> 8) Still sports the largest collection of 'masochistic' programmers.
ie a large base of programmers producing for it. Have you actually written anything on an ST? The OS is actually very nice to work with. Well designed and easy to use and doesn't get in your way if you wan't to replace bits with your own code for whatever reason. Fast too.

|> 7) Less time wasted reading thick, glossy monthly periodicals.
ST Review, ST Applications, ST format, ST User all land on my mat everymonth. Plus the ST section in Computer Shopper. I've also just reviewed 9 ST books for ST Review. Must have imagined it, there aren't any ST books are there??

|> 6) No portability 'problems' due to no portable notebooks or laptops.
Why should a portable have problems? Or are you totally misunderstanding the meaning of porting code? STacys and ST Books run ST software with no problems at all. Several people used STacys and GCR to get a portable Mac long before Apple woke up to the demand.

|> 5) Extensive collection of 'two' games available for the amazing
|> Falcon.
3 actually. Plus more on the way and many in PD. You can also run most of the ST ones too. Anyway, I bought my Falcon to do work, not play games. If I wanted games, I'd have bought a console.

|> 4) Limit of one dealer per metropolitan area promotes close friend-
|> ships.
I have several shops nearby and regualrly use many mail order outlets.

|> 3) One-piece design featuring 'mushy' keyboard way ahead of it's
|> time.
The keyboard ins't good. I've used worse though. The Falcon one isn't too bad.

|> 2) Ergonomically-placed joystick ports good practice for fumbling &
|> cursing.
With my hand on my heart I can honestly say the Joystick/mouse ports are a total abortion. Should have stayed on the side of the machine.

|> 1) Who really needs all those CD-ROMs anyway?
I can attach a CDROM (SCSI) to my Falcon. Just plug & go (more or less). There are also a few dedicated ST CDROMS. If I bought a CDROM, it would be for things like clip art libraries and fonts.

|> TOP 10 REASOMS TO BUY A MAC

>>that GEM is a lot simpler to use, and that is a result of it having a lot
>>less features. Hence the need for replacement Desktops.

>I disagree. The standard GEM desktop (TOS 2.0+) is as powerful as I have
>ever needed. I run no enhancers (or even replacement file selectors!)
>on my systems. Name some specific things I can't do...

errrr. Open more than 4 windows at once?? ;-) I`m sure theyve got past
this limitation by now though.

How about drag and drop operations like the Amiga AppWindows and
AppIcons? Here, you can simply do things like drag across a disk icon into
the standard file selector (which is an AppWindow) and that disk will be
selected for the directory choice. Same goes for AppIcons - drag a file
onto the AppIcon on the workbench and the application can load or
manipulate it.

What about standard system loaders? The Amiga OS provides a method of
defining file structures (like GIF/JPEG/Sound file) so that any program
can `load` the data thorugh these filters. Eg. Once you have installed the
GIF loader, any properly written application can load GIF files completely
transparently as if they were a standard IFF graphic. I have drivers for
JPEG/GIF/PCX/BMP on my system. Obviously, you need to code the application
to specifically use them though, so older (pre 3.0 software) cant use them.

A standard hypertext system? The AmigaGuide system provides an easy to
use hypertext system for reading program documentation etc. Its similar to
the Windows help system. Even better, its implemented as a system loader
so a program like Multiview (which comes with the OS) comes into its own
here. You click on multiview, an AppWindow file selector opens and then
you drag a file into it. If it is an Amigaguide file, you get the
amigaguide hypertext viewer, A JPEG will load and decompress , an IFF
sound will play etc.

A nice standard program installer system? The OS supports an installer
system which provides a nice, easy to use way of installing software to
your HD. This is a great feature, it makes installing even complex
packages very easy.

Public Windows? Well, if you dont like the Amiga windows system you
wont appreciate them, but it allows applications to open their windows on
another applications screen - very useful for integrating applications.

The ability to assign a seperate icon to each file? And to `animate` it when clicked. PLus you can define tooltypes for each icon, similar to specifying command line arguments.

AREXX - not strictly part of the desktop but it is part of the OS and can make for a much more integrated desktop and multitasking system. Full interprocess communication and a powerful `batch` script system.

Full SHELL support. Its there when you need to do really low level operations that would take too long from the WorkBench. You can also execute shell commands from a command dialog requester opened from the menu bar.

Palette sharing - the OS provides inbuilt palette sharing so that if you are doing a lot of things on a single screen (not necessary with multiple screens available) it will make a `best choice` of colours for each program to use. The result is very impressive.

Object orientated controls like the Colour wheel. This is reusable by applications programs.

Of course, screens. But you dont seem to like those....

>> I think its better to have a powerful, standard, compatible desktop
>>than to have loads of seperate desktop add-ons. The features of the Amiga
>>such as screen switching and AREXX make integrating file-managament type
>>programs such as the excellent Directory Opus, very easy.

>Ugh. Screen switching is one of my biggest gripes about the Amiga, and
>is a complete turn off for me... It works for this UNIX text based
>interface,
>but If I have a GUI, I don't want multiple screens!

hmmm, you must be running your applications on a 1024x1024 24 bit screen then.... A problem with affordable personal computer systems is that you generally cant afford big, hi-res monitors (not to mention the system resources to run the large gfx arrays). By using screens, each application can have its own seperate screen memory and you can choose which one(s) you want to view. A very nice feature for multitasking systems and yet another example of how the Amigas desktop was designed around multitasking from the start, unlike the GEM desktop which is an inherently single-tasking desktop which has been bodged for multitasking.

If you have the monitor, you can always open a big screen for your applications on the Amiga. I prefer screens as they are faster, take less system resources and are the best solution for my low-rez monitor. We dont all have workstation displays...

>gavan has no idea about the power of this dsp.

The DSP is indeed very powerful, but is targetted squarely at digital
manipulations such as Fourier/Cosine Transforms, matrix maninpulations
etc. You constantly attempt to push it as speeding up any application
which is ridiculaous. eg Use it as a surrogate 882 (no thought as to how
you are going to handle usage when multitasking) or use it to do DPs in
the 65k colour mode. As I have consistently posted, the limits on this
doing this are the amounts of memory the CPU is required to shift. Using
the DSP actually INCREASES the workload on the CPU in this case, but that
doesnt deter you from making blanket `I can boost the performance with the
DSP` claims.

>:>>ooppss you forgot about the sound dma, answer your question for you!

>To do sound while using sound dma, you simple connect DSP OUT -> DAC,
>again gavan's knowledge is stunningly bad, ever heard of the falcon
>sound matrix?

Right, so in fact it not actally a SOUND DMA at all - a general pupose
DMA channel???? Tell me, how *DO* you now handle the fact that your DSP is
being simulatanously being fed/feeding data in/out of both this `sound
DMA` and host port channels? Sounds like a LOT of complicated syncronising
of IO is needed in your DSP code.
Moreover, the sound DMA will still add to contention on the bus, but
of course it would be better than using the CPU directly. And as I pointed
out, even with sound DMA the overload is too high on the CPU anyway.

Strange how the architecture implements a host port at all if this `sound
DMA` is so flexible.......

>yes the dsp cannot utilise all its power in some case because of the
>transfer problem, but careful programming gets around this in most
>cases.

Careful, thoughtful use of the DSP for *THINGS IT IS GOOD AT*. Not simply trying to shoehorn ALL your processing into it because it has more MIPs than your `databus challenged` 030. You dont seem to get that MIPS can mean different things on different processors. Just because the DSP has x MIPS doesnt make it more poweful than an 030 for processing. It just means it carries out more of its own SPECIALISED instructions per second.

>:>>actually for the 1600x600, mode I have it displaying 128x600 at the
>:>>moment ;-). I always said this was theoretical, but 1600x600 in other
>:>>modes have been acheived,

>:>your equally unfeasible 1600x600x65kcolour screen.

>You have no idea about what the Falcon is capable of, your lack of
>knowledge about of its DMA h/ware and things in general prove this. It
>is *painfully* obvious that you lack hard facts.

Youre saying then, that you CAN do a 1600x600 screen? The highest video throughput I`ve seen claimed for the F030 is 32 Mb/s which ISNT ENOUGH to do this screen. Its painfully obvious that you dont know even rudimentary computer hardware engineering.

BTW I *do* know what DSPs are good at, and this sort of half assed pixel manipulation isnt one of them. In this case, there is NO benefit in using the DSP to do your algorithms as the CPU memory access overheads are too high to actually allow any sort of data throughput.

>> It going to end up with me proving something like `you can do 160x100
>>in 14 FPS with 100% CPU contention` or some such similar spec.

>more like 22-27, I think I am in a better position to estimate than
someone
>with your lack of knowledge and experience, why would I lie?

To try and win a point.
Just post what sort of resolution and frame rate you are CLAIMING. Even better, if you have done it, say what figures you achieved.

>:> I`d still like to hear how many _BYTES_ of memory the DSP has, how wide
>:>the `Host port` is and the memory and task management facilities of the
OS
>:>with regard to the DSP.

>96KBYTES.

Wow! AND you have to send all data to and from it via I/O. It really cuts down on the sorts of applications you can use it for. Its still fine for `pipelined data` types of operations such as digital filtering though, which isnt surprising as thats whats it there for.

>all data types, byte, word,long etc, there are well over 50 functions...

But absolutely NO way of managing programs/data which are running in the DSP eh? Making it highly unsuitable for use as a general processing resource in a multitasking OS.

The Width of the host port will be important, as the smaller the width, the more transfers the CPU will have to do to it to shift a given amount of data. I see you havent posted the width - is it actually 8 bits/2 megs per second as I have seen posted by some here?

>(its funny how you have to ASK me about such stuff yet you argue with >me about implementation details - makes you look very silly IMO).

>The OS provides functions for transfer over host and using sound dma for

I like to see the specifics of the way the DSP interacts with the rest of the hardware. Its pretty *BLATENTLY OBVIOUS* to anyone who knows anything about computer hardware that the chips implementation is heavily designed around digital filtering (it is of course a Digital Signal Processor) and that only a real fool would attempt to try to shove generic computer algorithms onto it.

Excuse me, I have to go. My new spreadsheet program which uses only the blitter and the copper to do the data manipulation has finished indexing my 650000 record database - it does 25 index operations a second you know....

Gavan.

Well, Tempest 2000 not only has the original tempest game but 3 other
variations of it (2000, duo, and a third which I'm not sure what it is
called). The implementations are updated to take advantage of some of the
capabilities of the Jaguar. Die Hard Game Fan (in their review of it)
states that no other game machine is capable of duplicating the Jag
implementation of Tempest 2000.

:>of IO is needed in your DSP code.

Obviously two interrupts at the dsp end (two cycles each per interrupt :-))
is too much for Gavan's little brain to cope with.

:> Moreover, the sound DMA will still add to contention on the bus, but
:>of course it would be better than using the CPU directly. And as I pointed
:>out, even with sound DMA the overload is too high on the CPU anyway.

Sound DMA contention is negligable (I think it is HARD-WIRED).

:>Strange how the architecture implements a host port at all if this `sound
:>DMA` is so flexible.......

(laughs loudly at Gavan who knows so little about the DSP).

The host port is just one of the ports on the DSP, there are others (PORT
A,PORT B, PORT C(SSI/SCI). The Falcon links most of the ports in one
way or another, the SSI port can be connected to any part of the SOUND
matrix, (i.e. Sound dma), the SCI is connected to the external connector
(I think).

Your statement makes you look so STUPID, since Motorolla added all these
ports to the DSP 56001, perhaps you can give them some architectural tips.

:>>yes the dsp cannot utilise all its power in some case because of the
:>>transfer problem, but careful programming gets around this in most
:>>cases.
:> Careful, thoughtful use of the DSP for *THINGS IT IS GOOD AT*. Not
:>simply trying to shoehorn ALL your processing into it because it has more
:>MIPs than your `databus challenged` 030. You dont seem to get that MIPS
:>can mean different things on different processors. Just because the DSP
:>has x MIPS doesnt make it more poweful than an 030 for processing. It just
:>means it carries out more of its own SPECIALISED instructions per second.

In general the DSP delivers many more mips :

1. It is a modern chip with an orthogonal instruction set (compared to 68k)
2. It is highly parallel.

Dsp code is generally smaller than its 030 counterpart.

> BTW I *do* know what DSPs are good at, and this sort of half assed
>pixel manipulation isnt one of them. In this case, there is NO benefit in
>using the DSP to do your algorithms as the CPU memory access overheads are
>too high to actually allow any sort of data throughput.

lets see your amiga doing 1/2 million phong pixels per second then. (laugh).

:> Wow! AND you have to send all data to and from it via I/O. It really
:>cuts down on the sorts of applications you can use it for. Its still fine
:>for `pipelined data` types of operations such as digital filtering though,
:>which isnt surprising as thats whats it there for.
:>>all data types, byte, word,long etc, there are well over 50 functions...
:> But absolutely NO way of managing programs/data which are running in
:>the DSP eh? Making it highly unsuitable for use as a general processing
:>resource in a multitasking OS.

No the OS also provides dsp 'alloc' functions for organising programs
and having several resident. Again please do not spout crap without
knowing what u talk about.

:> The Width of the host port will be important, as the smaller the width,
:>the more transfers the CPU will have to do to it to shift a given amount
:>of data. I see you havent posted the width - is it actually 8 bits/2 megs
:>per second as I have seen posted by some here?
:>
:>>(its funny how you have to ASK me about such stuff yet you argue with
:>>me about implementation details - makes you look very silly IMO).
:>
:>>The OS provides functions for transfer over host and using sound dma for
:>
:> I like to see the specifics of the way the DSP interacts with the rest
:>of the hardware. Its pretty *BLATENTLY OBVIOUS* to anyone who knows
:>anything about computer hardware that the chips implementation is heavily
:>designed around digital filtering (it is of course a Digital Signal
:>Processor) and that only a real fool would attempt to try to shove generic
:>computer algorithms onto it.
:> Excuse me, I have to go. My new spreadsheet program which uses only the
:>blitter and the copper to do the data manipulation has finished indexing
:>my 650000 record database - it does 25 index operations a second you
:>know....

Its funny you should mention that, I've done a quicksort on the DSP that
sorts 7 times faster than the 030 version, I guess its only useful
for FFTs huh?? ;) (laughs at Gavan)

:>Gavan.

>>I disagree. The standard GEM desktop (TOS 2.0+) is as powerful as I have
>>ever needed. I run no enhancers (or even replacement file selectors!)
>>on my systems. Name some specific things I can't do...
>
> errrr. Open more than 4 windows at once?? ;-) I`m sure theyve got past
>this limitation by now though.

There is some such limitation on the STs with TOS<=1.6?
On the ST it did not really matter as a 640x400 screen is not big enough
for more windows. If it really bothered you you could get another desktop.

>
> How about drag and drop operations like the Amiga AppWindows and
>AppIcons? Here, you can simply do things like drag across a disk icon into
>the standard file selector (which is an AppWindow) and that disk will be
>selected for the directory choice. Same goes for AppIcons - drag a file

>transparently as if they were a standard IFF graphic. I have drivers for
>JPEG/GIF/PCX/BMP on my system. Obviously, you need to code the application
>to specifically use them though, so older (pre 3.0 software) cant use them.
>

I use GEMview3.1 which supports virtually all the formats you could want.
It also utilises the DSP for decoding JPEGs :) There are many others
available.

For viewing editing non exectable files I just installed EVEREST3

and...

Oh boy, I think we had better stop here. You really do not know what you
are talking about do you? It might be a good idea for you to actually talk
to someone who uses a Falcon/TT/STe before spouting like this. I can do
ALL of the above. You can add many more features with an OS addon like
Geneva or Neodesk (there are others I cannot remember)

Please get a clue; are you not getting tired of being wrong?

You obviously have never seen or used a new Atari (ie TOS>= 2.06)
and yet you insist on telling Atari users what you think (whish?) they do not
have. This is almost as sad as that guy claiming the ST did not have
bitplanes.

> throughput I`ve seen claimed for the F030 is 32 Mb/s which ISNT ENOUGH to
>do this screen. Its painfully obvious that you dont know even rudimentary
>computer hardware engineering.

I have a program that will do this on my RGB (the SVGA does not scan down
low enough). 1600x600x16 has been done.

It all depends on your screen REFRESH RATE! You know what that is don't
you? On my Falcon with a Magnavox Multiscanning Monitor as I adjust the
resolution the refresh rate adjusts automatically.

Just in case you do not know (it looks like you do not understand), if
your refresh rate is 60 Hz then your screen is being updated 60 times a
second. If it is interlaced at 60Hz it means that it is updating 1/2 the
screen at 60Hz and moving half the data/sec.

>
> BTW I *do* know what DSPs are good at, and this sort of half assed

IT IS NOT A GENERAL PURPOSE CPU!!!
It is an extremely powerfull co-processor. No one has ever claimed that it
can be used as a Central processing unit.

Oh well. So you're into general texture mapping then. I was thinking of
more specialized routines such as those in DOOM, which use raycasting to
speed up the rendering process. Raycasting requires the mapping to be done
vertically, and speeds up rendering immensely since you're guaranteed to
never plot invisible points, which you usually have to in the polygon case.

Yes the type of texture mapping I'm 'into' is for 3d world type stuff,
where the viewpoint can be from any angle, its really wrong of me
to call mine texture mapping its really 'texture squashing' ;-). Does Doom
use real tmapping? i.e. recalculating the perspective at each point?

|> for ALL currently available PC technology. Frame by frame rendering is the
|> way it goes.

True. NOT EVEN THE SGI is goind that type of rendering, unless you use
a Reality Engine :-) (read more than US $60,000). You can get away for
television with the other cards though, but most of the software
don't use them for rendering...

[stuff deleted]

Exactly. While the Falcon has a little edge with the DSP, problem
is the lack of a 24-bit palette.... and that you get a 50Mhz '030 machine
with 50Mhz FPU for a Falcon price :-)

Gavan, while that seems to be quite true of Atari's (I remember the
Atari Explorer issue with: "Will piracy kill ATARI?" on the cover),
that is also true of Amiga people... it's just that the market is
bigger and thus can absorb that problem a bit better... but it is
still a problem though.

```

Ouch! I didn't think about that... True, true, true... I guess you just
find the 'distance' like the size of the column and then start drawing
that line squashing the texture on it... it's definitively more calcs
though.

```
|>

Gavan: post official AMiga developer information that says that one should consider a 1200 with fastram and extra CPU etc. the base machine for any development (even games!) I have already done so with the Falcon info stating that 4 meg/85 is the base Falcon machine. If you can do that and have several developers supporting you, then maybe someone will believe you. Until then, shut up about this subject.

~Chris

> I remember that too! Atari probably just changed that later...

You must be confused with the fact that the first shipments were only of the 4/85 config, and it took time for the 1/0 and 14/85 meg shipments to come in. (The former becausr they wanted to meet the demand for the base units before releasing the expander units, and the second because 14 meg boards were in very short supply and/or delayed)

Yep. Drag & drop fully implemented in 2.0 +

> What about standard system loaders? The Amiga OS provides a method of

>you drag a file into it. If it is an Amigaguide file, you get the
>amigaguide hypertext viewer, A JPEG will load and decompress , an IFF
>sound will play etc.

Personally I find Hypertext stuff to be completely useless... I think that there is some sort of standard, though, for manty programs are coming out with hypertext-like help systems...

> A nice standard program installer system? The OS supports an installer

>your HD. This is a great feature, it makes installing even complex
>packages very easy.

Gee, since all I've ever had to do was run something called "INSTALL.PRG" and away it goes, I wonder why such a thing is necessary? SOunds more limiting than it's worth... (i.e. features you might want to incorporate into your install, but since you are morally bound to use the standard installer you are out of luck)

> Public Windows? Well, if you dont like the Amiga windows system you

Well, since I hate screens on a GUI... I have one screen and all my windows open on it... that's the way I prefer it!

> The ability to assign a seperate icon to each file? And to `animate`
>it when clicked. PLus you can define tooltypes for each icon, similar to
>specifying command line arguments.

Well, animation comes with color Icons (TOS 4.0+) but custiom Icons are 2.0 +

> AREXX - not strictly part of the desktop but it is part of the OS and
>can make for a much more integrated desktop and multitasking system. Full

Nope, 800 x 600 x 16 for most work, switch to 640 x 480 x 256 for most
graphics work, and occasionally to True Color for those sort of graphics.
(I only have the freeware demo of BlowUP, hence the expanded res only in 16
colors. When using my Crazy Dots card onm the MegaSTE, I tend to run in
800 x 600 x whatever color depth I need most)

> If you have the monitor, you can always open a big screen for your
>applications on the Amiga. I prefer screens as they are faster, take less

>all have workstation displays...

I have a 14" monitor (cost me about $450 new, prolly worth less now) does
800 x 600 NI, 1024 x 768I (I've gotten it to run even higher, but the
interlave flicker gets annoying...)

~Chris

(all in all, I must say, quite a reasonable post on your part, Gavan)

>I proved both these points, you make me *yawn* gavan.

Youve proved NOTHING on the DPs and you ended up `proving` that you
could get the DSP doing FP mults as fast as a 16MHz 882 - never mind that
there was no way of handling DSP multitasking properly, or that there
wasnt a SINGLE program which used this method or that there are NO
compilers which provide DSP FP libraries - I wonder why not?

ANY task? Then why isnt it used as a CPU then if its so shit hot? Its
just a dedicated co-processor, very good at its own niche but not suitable
for the sorts of general programming algorithms that you expect it to
perform every time you go on about using the DSP to boost program
performance.

I have POINTED OUT in this case that the transfer time is indeed too
much of an overload (well, the CPU overhead for transfer that is). You
still cant seem to accept basic engineering principles.

:-))
>is too much for Gavan's little brain to cope with.

Yeah, right. Youre handling this `sound DMA` and stuff being sent down
the host port and more stuff being sent down the host port to update the
DSP playfield and a simple interrupt handler routine is gonna route all
this data to the proper place - ha ha!

>:> Moreover, the sound DMA will still add to contention on the bus, but
>:>of course it would be better than using the CPU directly. And as I
pointed

>Sound DMA contention is negligable (I think it is HARD-WIRED).

HARD WIRED?? Whats that supposed to mean. If you are doing DMA from
the memory it has to be done via the databus (unless you have a seperate
DSP DMA databus and dual ported RAM). It will add to the overall system
burden, but not as much as having to dedicate the processor.

>:>Strange how the architecture implements a host port at all if this
`sound

>Dsp code is generally smaller than its 030 counterpart.

More mips mean nothing in this context. Its what those instructions do
that counts. You SEEM to be implying that the DSP is better for general
purpose processing than the 030 but I`ll give you the benefit of the doubt

as no-one could be that stupid.

>knowing what u talk about.

Right, so your saying that the OS **DOES** handle program and data
organisation in the DSP memory(all 96k of it). I doubt that it has ANY
kind of task management - maybe you mean that you can send and retrieve
data to it via OS routines and that the management is very much up to the
programmer?

:> The Width of the host port will be important, as the smaller the
width,

>sorts 7 times faster than the 030 version, I guess its only useful
>for FFTs huh?? ;) (laughs at Gavan)

hmmmm, even on REALLY LARGE files? I suspect your routine deals with
lists which fit entirely in the DSP memory.

I look forward to the release of all this software on the DSP.
Considering there is so little of it at the moment, theres obviously about
to be an avalanche from you alone.....

BTW Still waiting to see what screensize/framerate you claim for your
256DP technique.... I thought you`d already coded it.

Gavan.

Or if you had an AMIGA, you could open a seperate SCREEN for each
application. Its great to have a computer which was designed for
multitasking from the outset, and didnt just start with a port of CP/M 68k
and a mac-wannabe GUI that was crippled by Apple legal action.

I`ll admit that the Atari has come a LONG way towards catching up with
the Amiga since the days of GEM/ST. The Falcon with MiNT is much better
than the older ST system, but the fact remains that backward compatiblity
and the gradual adding in of MultiTasking has meant that the Falcon is
still nowhere near the Amiga for a multitasking GUI. It does have a nice
UNiX a-like OS though.

>For viewing editing non exectable files I just installed EVEREST3

errr, actually READ MY POST. I was talking about things called
`datatypes` on the Amiga. They are kind of like printer drivers in
reverse(!). ie. They allow you to import various kinds of data through the
OS. Hence once you have a program that imports graphics, say, you can
provide it with any kind of datatype to let it load the appropriate gfx
format. So, I can pop a disk with a GIF or PCX or JPEG file on it and any
of my datatype-aware programs can transparently access the graphics data

contained within. Same goes for things like text viewers or even
potentially things like databases and spreadsheets....

You seem to be confusing this with an individual program having the
ability to load many formats. I can understand this modern OS concept of
datatypes being alien to you after so long being forced to use an ST ;-)

>Oh boy, I think we had better stop here. You really do not know what you
>are talking about do you?

yes, maybe we had before you REALLY make a fool of yourself.

> It might be a good idea for you to actually talk
>to someone who uses a Falcon/TT/STe before spouting like this.

Hey! If I ever actually MET anyone who used a Falcon I`d LOVE to see
the machine in action. Unfortunately, with only 35000 owners spread over
the globe they are a little thin on the ground. I have used STs/STes
though and I`m NOT impressed. The STe was Ataris pathetic attempt to try
to match the Amiga and it didnt even come _close_. Too little, too late.

> I can do
>ALL of the above. You can add many more features with an OS addon like
>Geneva or Neodesk (there are others I cannot remember)

Actually, Jack, the poster was asking about the STANDARD OS DESKTOPS.
The whole point was to see what sort of functions the destops provided
without adding on extras/new desktops.

> Please get a clue; are you not getting tired of being wrong?

Please get a clue; are you not getting tired of being wrong? :-p

>You obviously have never seen or used a new Atari (ie TOS>= 2.06)
>and yet you insist on telling Atari users what you think (whish?) they do
not
>have. This is almost as sad as that guy claiming the ST did not have
>bitplanes.

Again, the poster wanted to know what sort of features the standard
Amiga OS had that the GEM desktop didnt offer. I posted a list of points,
so what happens next is that Atari owners will post back flaming me and
pointing out that the GEM desktop has xxx or yyy.

You, however, dont seem to have answered _any_ of my points (apart
from getting the datatypes issue WRONG).

how original.

Gavan

Again, please read back a few lines through the post. The bane of
contention is over doing 1600x600 at 65k colours, not 16. Way, way back I
worked out that the b/w needed for this rez at 50Hz interlaced was
something like 46Mb/s which exceeds even the claims of advocates on this
group about the Falcons video bandwidth.

>It all depends on your screen REFRESH RATE! You know what that is don't
>you? On my Falcon with a Magnavox Multiscanning Monitor as I adjust the

>second. If it is interlaced at 60Hz it means that it is updating 1/2 the
>screen at 60Hz and moving half the data/sec.

look, try doing the sums yourself.
Heres a clue : There are two bytes per pixel
1600x600 pixels per screen
and 25 full screens per second (thats as a result of interlacing
at 50 Hz)

[stuff about dsp suitability deleted]

>IT IS NOT A GENERAL PURPOSE CPU!!!

|> 1) Future Amiga's will be PowerPC based.

Not what I would predict from reading the following. If anything, the 3D rendering stuff reminds me more of PA-RISC, which would be a logical way to go for a MM machine such as the Amiga, considering that it also has MPEG support built in.
Note also that there's (or will soon be; never can be sure about release dates) SoftWindows support for HP workstations, so PA-RISC is supported in this area.

|> 2) We will se a lot more support for the virtue's of NT than we used to!

Probably not from Amiga users, anyway. We love AmigaDOS, don't we?

|> "The new generation of machines have a RISC core, will be DOS compatible

:>>:>which is ridiculaous. eg Use it as a surrogate 882 (no thought as to how
:>>:>you are going to handle usage when multitasking) or use it to do DPs in
:>>:>the 65k colour mode.
:>>I proved both these points, you make me *yawn* gavan.
:>
:> Youve proved NOTHING on the DPs and you ended up `proving` that you
:>could get the DSP doing FP mults as fast as a 16MHz 882 - never mind that
:>there was no way of handling DSP multitasking properly, or that there
:>wasnt a SINGLE program which used this method or that there are NO
:>compilers which provide DSP FP libraries - I wonder why not?

Gavan you keep coming back for more and more. DSP = 16-20mhz 68882 for
FP stuff, (many times faster at integer stuff). Who mentioned multi-
tasking? Now you do mention it you dig yourself another hole, ever heard
of semaphores? As for your claim about no program using the DSP for
FP maths, you obviously haven't seen some of the falcon fractal programs.
Gavan you really are a mindless unknowledgeable Moron.

:>>the CPU bandwidth is THE limit, the DSP can do ANY task faster than the
:>030,
:>>not just matrix multiplication etc, only if the transfer time is longer
:>>than the time saved is it not worthing doing (this a rarely the case).
:> ANY task? Then why isnt it used as a CPU then if its so shit hot? Its
:>just a dedicated co-processor, very good at its own niche but not suitable
:>for the sorts of general programming algorithms that you expect it to
:>perform every time you go on about using the DSP to boost program
:>performance.

The DSP can outperform a 16mhz 16030 at just about any task. Even if it
was a really crap algorithm which was awkward to implement you would still
get at least an equivalent '8mips' worth.

:> I have POINTED OUT in this case that the transfer time is indeed too
:>much of an overload (well, the CPU overhead for transfer that is). You
:>still cant seem to accept basic engineering principles.

The transfer time is not much of a problem for all but the most trivial
of algorithms. (the 68k algorithm is more than about 5 instructions its
quicker to do it on the dsp). So what stuff have you programmed on the
DSP to justify what you say. Why would I lie? *I KNOW WHAT I'M TALKING
ABOUT* YOU DO NOT.

:>>Obviously two interrupts at the dsp end (two cycles each per interrupt
:>:-))
:>>is too much for Gavan's little brain to cope with.
:> Yeah, right. Youre handling this `sound DMA` and stuff being sent down
:>the host port and more stuff being sent down the host port to update the
:>DSP playfield and a simple interrupt handler routine is gonna route all
:>this data to the proper place - ha ha!

As I said Gavan has a small brain.

:>>:> Moreover, the sound DMA will still add to contention on the bus, but
:>>:>of course it would be better than using the CPU directly. And as I
:>pointed
:>>:>out, even with sound DMA the overload is too high on the CPU anyway.
:>>Sound DMA contention is negligable (I think it is HARD-WIRED).

:> HARD WIRED?? Whats that supposed to mean. If you are doing DMA from
:>the memory it has to be done via the databus (unless you have a seperate
:>DSP DMA databus and dual ported RAM). It will add to the overall system
:>burden, but not as much as having to dedicate the processor.

Its always ON. (you can't turn it off, although some hackers apparently
found some kludged way of doing it). Answering lots of your questions
Gavan, doesn't this suggest that I know about these things?

:>>The host port is just one of the ports on the DSP, there are others (PORT
:>>A,PORT B, PORT C(SSI/SCI). The Falcon links most of the ports in one
:>>way or another, the SSI port can be connected to any part of the SOUND
:>>matrix, (i.e. Sound dma), the SCI is connected to the external connector
:>>(I think).
:>
:> You _think_? Now who doesnt know his stuff?

Is that your only reply? How SAD, I noticed you deleted the stuff you
wrote about the architecure being bad, its funny how I have to explain
everything to you, but I'm glad to be part of your education.

:>>In general the DSP delivers many more mips :
:>
:>>1. It is a modern chip with an orthogonal instruction set (compared to
:>68k)
:>>2. It is highly parallel.
:>
:>>Dsp code is generally smaller than its 030 counterpart.
::>
:> More mips mean nothing in this context. Its what those instructions do
:>that counts. You SEEM to be implying that the DSP is better for general
:>purpose processing than the 030 but I`ll give you the benefit of the doubt
:>as no-one could be that stupid.

Not better for general purpose computing, but this is ONLY because of the
way it represents numbers, it is better for implementing most sound/graphic
algorithms, I can give lots of examples.

:>>lets see your amiga doing 1/2 million phong pixels per second then.
:>(laugh).
:>
:> And WHY would I want to do 1/2M phongs pixels per sec? MORE demos?????
:>Wheres the useful software?

I suppose a SGI workstation is pointless to because it does 50,000,000 /sec?
(laughs at Gavan,yet again)

:>>No the OS also provides dsp 'alloc' functions for organising programs
:>>and having several resident. Again please do not spout crap without
:>>knowing what u talk about.
:>
:> Right, so your saying that the OS **DOES** handle program and data
:>organisation in the DSP memory(all 96k of it). I doubt that it has ANY
:>kind of task management - maybe you mean that you can send and retrieve
:>data to it via OS routines and that the management is very much up to the
:>programmer?

The Falcon TOS is to multitasking, it would be possible to do simultaneous
context switching at both ends (I do this in my tracker driver).

> [host port stuff deleted]
> I`m still seeking clarification on the above point. Is it *8 BIT* or
>not?

yes 8 bit high speed parallel. delivers 2meg/s using the OS calls or
3meg/s if you hit the hware.

:>>Its funny you should mention that, I've done a quicksort on the DSP that
:>>sorts 7 times faster than the 030 version, I guess its only useful
:>>for FFTs huh?? ;) (laughs at Gavan)
:> hmmmm, even on REALLY LARGE files? I suspect your routine deals with
:>lists which fit entirely in the DSP memory.

Gavan obviously knows nothing about quicksort -> i'll just say that the
DSP deals with subsets of 256 or less. (GAVAN you speak yet more rubbish).

:> I look forward to the release of all this software on the DSP.
:>Considering there is so little of it at the moment, theres obviously about
:>to be an avalanche from you alone.....

So what have you done Gavan? (laugh)

:>BTW Still waiting to see what screensize/framerate you claim for your
:>256DP technique.... I thought you`d already coded it.

26FPS 320x200 True colour.(wait for my next demo, cue Gavan to slag off
demo writers)

>of my datatype-aware programs can transparently access the graphics data
>contained within. Same goes for things like text viewers or even
>potentially things like databases and spreadsheets....
>
Ok I was wrong. I did not realise you were talking about a low level OS
feature. I thought you were talking about having the OS redirect the file
you want to load to the appropriate destination program along with
parameters etc. Not as far as I know the ST does not have data type
definitions built in to the OS. You can install TSRs that any program may
want to call which would be the similar except then it wouldn't be a
STANDARD OS feature :)
Once that driver is installed (ie a GIF/JPG driver) any 'aware'
program may use it.

>> It might be a good idea for you to actually talk
>>to someone who uses a Falcon/TT/STe before spouting like this.
>

You are full of shit. You have not even used the OS in question or do not
know anyone that has used it and yet you make these idiotic claims.
No the Atari OS does not as far as I know ahve built in 'data drivers'
since that is all taken care of by the software in question. You can
redirect files to the appropriate destination though.

>> I can do
>>ALL of the above. You can add many more features with an OS addon like
>>Geneva or Neodesk (there are others I cannot remember)
>
> Actually, Jack, the poster was asking about the STANDARD OS DESKTOPS.
>The whole point was to see what sort of functions the destops provided

>Amiga OS had that the GEM desktop didnt offer. I posted a list of points,
>so what happens next is that Atari owners will post back flaming me and
>pointing out that the GEM desktop has xxx or yyy.

Well if you start claiming that The Atari OS does not have xxx or yyy and
it DOES then you are WRONG!! so admit it and shut up or bugger off.
All your above points except the data drivers were wrong.
You found 1 so far.

>
> You, however, dont seem to have answered _any_ of my points (apart
>from getting the datatypes issue WRONG).
>

Yes I misunderstood that part and no the Atari OS does not have (to my
knowledge) builtin data drivers such as implemented in the Amiga.
Not a problem IMO but that is, I admit, besides the point.

re: other stuff like shells etc...

Multitos is I believe POSIX compliant and you can use a variety of shells
such as bash, korshell, csh etc..

re: assigning icons: of course you can do it.

re: public windows? I can open as many GEM windows as I want with MTOS

re: standard installer? What? You catually need a SPECIAL INSTALLER
feature in your OS?. If I have I really 'complex' program to install i run
INSTALL.PRG. This sound like a waste of memory to me. Usually you do not
even need to do that; all you have to do is drag all the stuff from the
floppy window to the window where you want the program.

re:colour wheel? I do not know what that is but there is a part of the
Control Panel that lets you set the Palette, window collors. You can also
set the desktop pattern/collor, window fonts etc...

You also have STANDARD accesories for sound (change ballance, gain,
volume etc...), a System Audio Manager that lets you record your own
samples to HD and assign them to desktop events.

You can also define keyboard equivalents for every menu function of the
desktop (so that you do not have to drag the mouse to the menu bar if you
do not want to).

ie 'l'=locate file , 'v'=change res, 'c'=close window, 'w'=cycle through window etc...

As far as high quality video diaplays go I think the Falcon wins there as well (more video bandwidth you know and you can set the resolution to whatever you want provided you don't exceed the bandwidth or your monitors scanning capabilities:)

1272. stupid postings

Newsgroup: comp.sys.atari.advocacy
Date: 1994-03-08 22:20:11 UTC
From: TOMM@cms.cc.wayne.edu
Message-ID: <16F73F3CBS85.TOMM@cms.cc.wayne.edu>
Source record: 18123

There sure is a lot of stupid bullshit on this newsgroup.

Peter, Gavan and Ricardo apparently have nothing better to do than
blast Atari users because they use Ataris. Why should they care?

Griff seems to like to fan the flames of these assholes. Occasionally,
someone posts an opinion that might be of some interest to someone other
than himself, but then there is a non-stop flow of:

you said:
Yeah but you said:
You idiot, read my post, I said:
You don't know what you're talking about....
"No one could be that STUPID"
"*I KNOW WHAT I'M TALKING ABOUT* YOU DO NOT"
"You still can't seem to understand basic engineering principles"
"I proved these points"
That's not possible...
"I'm glad to be part of your education"
"... has a small brain"
You said:
I already said:...

What a waste of time. Do all of you really think that you have
something important to say?

I fail to understand why Amiga and Mac bigots spend so much time
posting here. Pay attention, you Bozos, this is a group for Atari.

There is nothing to be gained by getting on here and telling us that
we are stupid for buying Ataris.

ANYONE who really believes that Ataris/Amigas/Macs/PCs/PS2s/SGIs/DECs/etc
are the only computers worth having and that all others are useless
doesn't know ANYTHING. ALL of these machines have some advantages
over ALL of the others.

The only point to all of this bickering is to spread so much shit
on the little useful information as to make the entire discussion
group useless.

By far the worst offender is sinclap. You rude jerk, Peter Dickhead.
I'm glad you like your Mac. Get the hell off of this group. You
do not belong here. You NEVER have anything constructive to say.
You don't post on the Mac groups, do you? We sure don't care what
you think. You must really be afraid of Atari and Commodore.

|>
|> Oh, yeah right. Griff, someone here needs a bit of education... and
|> it's not me! ;-)

Quite. I may dislike PC's, but the 486 DX2 66 machines I've seen redraw their desktop substntially faster than the Falcon, A1200 or even the A4000 (using standard AGA) could ever hope to. (Unless you're using an A4000 with something like a Spectrum or Rainbow III card of course. :-))

You may want to advocate your systems against the PC, but spouting rediculous statements like that will only hurt your case.

You NEVER posted any information supporting this claim. If you wish I will post the whetstone results for a 25MHz 68882. You do the same for the DSP. BTW, I'm talking double precision here.

|> 26FPS 320x200 True colour.(wait for my next demo, cue Gavan to slag off
|> demo writers)

Demos are all about pulling all kinds of clever tricks to get the hardware to look like it's doing better than it should be able to. They look very pretty and everything, but are otherwise totally useless. I respect the programming ability of someone who writes a decent icon editor, or wordprocessor for example, much more than I respect the programming ability of someone who just churns out routine after routine of illegally coded hardware bashing, which is the sort of coding almost entirely responsible for incompatibility problems on the Amiga.

>>>>is *painfully* obvious that you lack hard facts.
>>
>>> Youre saying then, that you CAN do a 1600x600 screen? The highest
^^
This is the reason I mentioned the 1600x600x16 screen being possible on an RGB

>
> Again, please read back a few lines through the post. The bane of
>contention is over doing 1600x600 at 65k colours, not 16. Way, way back I
>worked out that the b/w needed for this rez at 50Hz interlaced was
>something like 46Mb/s which exceeds even the claims of advocates on this
>group about the Falcons video bandwidth.

What idiot said it had to be @50Hz interlaced? If you only have an RGB
monitor the you cant do this. If you drop the refresh rate low enough on
your Multiscanning monitor it might be possible.

[Gavan shows he understands]

>
>look, try doing the sums yourself.
>Heres a clue : There are two bytes per pixel
> 1600x600 pixels per screen
> and 25 full screens per second (thats as a result of interlacing
> at 50 Hz)

I apologise. I missed the part where someone claimed it could be done at
50Hz interlaced. I do not think it was Griff anyway

It obviously cannot be done on an RGB (or regular VGA) monitor. You might
achieve this with an appropriate monitor.

>
>[stuff about dsp suitability deleted]

> My point exactly! However certain nameless individuals here have make
>regular claims about it being more suitable for ANY task than the CPU.
^^^^^^^^^^^^^^^^^^^^
<taking such a statement out of context says a lot about your honestly IMO>

Well for most calculations I believe it will be faster (I am not an expert
on the DSP but I see no reason not to believe Griff on this).
Whether it is more suitable for certain tasks than the CPU is a system issue.
Even though it is extremely fast it cannot act as a CPU. It is
axtremely good at processing streams of data which does make it suitable
for many sound & video processing applications. The fact that it works in
parallel with the CPU makes this even better (ie it is implementted in the
architecture pretty well).

The man keeps giving you examples of where one might use the DSP
effectively but you keep ignoring them.

>
> Please, keep up YOUR posts. I could do with a little light relief
>every now and then. Its sooo nice to completely trash someone who cant
>even seem to grasp the points of postings....
>

Do not worry, I will post the promised quotes from the my DSP manual. You
do not believe Griff who knows a lot about the Falcon hardware and
programming the DSP but maybe looking at a Motorolla manual will convince
you of its aplicability in areas other than sound processing

>application. Its great to have a computer which was designed for
>multitasking from the outset, and didnt just start with a port of CP/M 68k
>and a mac-wannabe GUI that was crippled by Apple legal action.

Typical nonsense. TOS is Not a CP/M 68K port. The prototype STs that were
shown (back in 84 or so) were kludged together with such a thing, but Atari
went with GEMDOS as the OS for the release STs, which ios a completely
different (i.e. written new from the ground up) OS and not a port!
And the "mac-wannabe" line is just pathetic. PC Gem was hampered by the
Apple lawsuit, but Atari changed nothing about it for the STs, and the fact
that GEM is far better than the Mac Desktop anyway makes that point irrelevant.

1277. Atari Info Wanted

Newsgroup: comp.sys.atari.advocacy
Date: 1994-03-09 05:04:10 UTC
From: tlrsidp@nmt.edu
Message-ID: <1994Mar9.050410.1792@nmt.edu>
Source record: 18128

Ok, I'm selling my Mac LCIII and will probably buy another Mac, but I'm always curious as to my options. (No flames as to my computer of choice I had an Atari 800 and 1040st in the past....) I'd like to purchase a system w/ an '040 standard (i don't want to have to upgrade to one) and possibly DSP's onboard. (The 660av mac is the system I'm serious looking at) I'm not too critical as to available software, but I'd like to know the status of commerical software in the Atari Market. So, does Atari make any computer that would satisfy what I want. I'd like info on prices, standard configs, video display options (ie vram/accelerator chips).

thanks in advance

tlrsidp@black.nmt.edu
email info or post (i check both regularly)

ps i also would like to know if there was a way for me to connect my HP 550c (AppleTalk Connector) to an Atari.

The problem with this notion is that if it were true, then only PC
platforms would be developed for. There is still lots of good
software development going on even on the ST platform (which is quite
a bit larger than the Falcon base alone, and if you write apps it will
still work fine on the Falcon).

>
>Lots of PC games and applications require a 486 at least, with 486 dx2/66

This is a bit different, becuase the games for such a system would
not be possible on anything less - plus of course the numbers of these
systems are still vast, so they can get by aiming above the base
config.

Probably so in the Foalcon case, but don't forget that the Falcon is
not alone - there are TT's, and a large base of ST's.

You just canniot admidt when you are 100% wrong. Find one message in
the last TEN CENTURIES on this base that claims you cannot buy a 1MB
Falcon. Surprize!!!!!!!! You can't. That is because NO ONE HAS EVER
STATED THIS. Do You Under Stand? Earth to Gavan...

Additionally, you must have some sort of really bad disease taht
affects long and short term memory - from the beginning of the silly
base config discussion, I have claimed the 1MB machine was an
upgrader. That is, it is not a "recent line", as you so arrogantly
claim.

As for including any memory, you are right - that is a little silly.
But quite simply, the base Falcon config is 4/80. How many people out
there have a 1MB/no HD Falcon? Answer = NONE.

>
> Seems to me its a ploy to sell more as they`ve seen how the A1200 sold

Will PG3 require this setup? If it requires less memory and such,
then how can you say the base Amiga config is 6/80 (which I really
doubt).

True enough, and the number of other ST people around will hopefully
sway Pagestream into making an Atari version. If they don't, I'll get
Calamus... but I really do like Pagestream, and would really love to
see a newer version.

>

The base Falcon config is 4/80, just as I'm sure the base application
Amiga config is higher than 2MB chipram/0HD

> You can actually buy A1200s here in a 6 meg (2 chip/4 fast) 85 megs HD

>"how many buyers will opt for a Falcon AT ALL".

A smaller number, perhaps... but still some.

TOP TEN REASONS TO BUY A MAC
----
10 - Much wider selection of anti-virus software (and viruses!)
9 - OS speed allows one to have long coffee breaks, and take many naps.
8 - You haven't lived until you see a Mac take your valued disk hostage.
7 - Where else can you buy a machine from a company that would patent
the human hand if only it weren't for those pesky lawyers...
6 - Screen savers take up whole processing time, giving excuse why no work
is done.
5 - System 7.0 is just chock full 'o features!
4 - Forces you to expand to huge disk to store nifty sounds, wallpaper, etc...
3 - Don't need to know anything about computers - can just sit 'n drool.
2 - Who needs joysticks, or interesting games?

And the number one reason to buy a mac is....

1 - Peter Sinclair-Day will be your personal slave!

1289. 3D DOOM like tmapping

Newsgroup: comp.sys.atari.advocacy
Date: 1994-03-09 09:04:00 UTC
From: rickard.troedsson@secom.ct.se
Message-ID: <2d7d9120@secom.ct.se>
Source record: 18140

The discussion Raist and Griff's had about "cheat" texturemapping, converting it to a single interpolation problem, seems to be exactly what I've been writing on for a few days .... thought I could add my views on it .. ;)

I'm using the whole screen, 320*240*65536, ceiling and floor being 90 pixels "high" on the screen. (Same then goes for the "width" of the walls when standing in the middle.

Movement can (for now!) be done forward/backward and rotating left/right. (Sliding will follow today hopefully)

Ceiling and floor done using a horisontal tmapping routine, with one interpolation per line. (VERY fast). (Adding a skew factor for the angle when rotating, takes no time at all compared to the tmapping)

Walls CURRENTLY using one interpolation per line, vertically drawn, and a skew factor for the rotating. (will have to change to two or three as it seems now)

Ceiling/Floor/Walls also using a "distance" factor, making things far away move slower than when they're close. Takes no extra time compared to the tmapping .. :-)

Oki ... speed .... 320*240*65536, on a 16Mhz 030, using move.l (no bl**dy 16bit bus here!) on a VGA monitor...(will be twice as fast on RGB/TV) ...

15fps

Take it for what's it worth, I may develope this into a game ... there's some things I can optimize further and there are some features to add, the fps rate should hold though ...

I guess what I'm trying to say is that I'm using *NO* 3D calculations or polygon graphics .... but it looks as if I did ...

(Interesting fact: The resolution of the source bitmap does not affect speed. I can avoid pixelation totally if one can stand the "shrinking" far far away ... it looks best if maximum is 2* pixel and mininum 0.5* pixel though)

The A1200 has sold quite a bit... you like it or not.

|> That can't be right,

[about CD-32 sales]

Why not? The CD-32 in the UK has turned out to be the leading seller
of *any* CD-ROM type thingie.

That has been reported by independent organizations... but then, in
the U.S. that would be a *very* different story :-)

>that is also true of Amiga people... it's just that the market is
>bigger and thus can absorb that problem a bit better... but it is
>still a problem though.

Yes, Piracy exists on all platforms and I suppose it had a greater
effect on the Atari market as it had less users to start with. Look at the
PC, *massive* piracy but a huge market means its still profitable to make
software for it. Even so, a lot of ST owners were ex 8-bit owners and they
seemed to take the 8-bit Atari piracy scene over with them when they got
their ST. Even as the ST was announced, many 8-bit pirates were selling
their 8-bit systems and planning to buy STs and do ST piracy in a big way.
I cant get over how one ST owner recently boasted to me about how he got
his copy of ST Streetfighter 2 a month before release .. and then
complained about not having Mortal Kombat come out on his machine!!!!!

Maybe I`m just too optimistic but it seems that piracy is on the wane
on the Amiga - attitudes are changing. Plus CD32 means that more Amiga
stuff is coming out on CDROM which will help cut piracy.

BTW Raist, do you get AUI Magazine in the US? This month they had a
covermounted Amiga CD!! I thinks its a first for an Amiga magazine.
Apparently they are launching a new mag soon which will have a CD on the
cover every month! And so are the makers of Amiga format. Just think of
the potential for serious as well as gaming use - you could put GCC 2.5.8
(or whatever) with say ToolManager and magicWB on just a part of the CD
and shove it on the cover of your magazine. I bought the CD anyway, I`ll
have to see if I can use a PC-CDROM to get some of the files off to take
home...

>you.
>Until then, shut up about this subject.

As I have said - the point is that there ARE lots of A1200s with
fastRAm etc so developers develop for them. Are you saying that serious
software such as ADPRO, ProPage, Imagine etc is developed to fit a 2 meg
base machine??? I have 6 megs and its really not enough to run ADPRO or
Imagine to anyrthing like their capabilities.

Developers develop software for which there is a market - there is a
bigger market for software which needs an Amiga with 4 megs+ and a HD than
there is for a Falcon, so it gets more (and better) serious software. Name
ONE major application on the Amiga that has been designed around a 2 meg
chip only system....

Of course, the PC market is bigger still which is why it gets the
lions share of serious applications. Thats just the way it is. The fact
that there is more serious software support for the Amiga than the Atari
is just an extra feather in its cap.

>>use hypertext system for reading program documentation etc.

>Personally I find Hypertext stuff to be completely useless... I think
>that
>there is some sort of standard, though, for manty programs are coming out
>with hypertext-like help systems...

Nearly every big PD release on AmiNet these days has an AmigaGuide
help document. They are really easy to use and standard over all releases
of software so you can get the info from the docs quicker than reading
through a massive ascii doc file.

>> A nice standard program installer system? The OS supports an installer
>>system which provides a nice, easy to use way of installing software to
>>your HD. This is a great feature, it makes installing even complex
>>packages very easy.

>Gee, since all I've ever had to do was run something called "INSTALL.PRG"

>are out of luck)

The C= installer is VERY powerful, with trace and `dummy install`
functions available. Since it is standard for every program it makes it
easy and hassle free to install even really complex packages.

If you REALLY want to do something weird when installing, you could
always resort to making your own installer but then youre going to piss a
lot of users off who appreciate the standard installer.

>> AREXX - not strictly part of the desktop but it is part of the OS and
>>can make for a much more integrated desktop and multitasking system. Full
>>interprocess communication and a powerful `batch` script system.

>Not quite clear on what it is, but sounds like the interprocess
>communications since TOS 1.0 Much improved with MTOS...

Its a complete interpreted language - not Amiga specific as OS/2 and
some IBM mainframes have it too. Its based around pattern matching, but
has full interprocess comms features. ie. If a program provides an AREXX
`port` then AREXX can use that program kind of like a language subroutine.

This means rather than make a macro language, you give it an AREXX port and use AREXX to do your macros. You can also write AREXX programs to mediate between two applications to integrate them. Multimedia apps can use AREXX to control things like laserdisks/video tape - you write a driver for teh device and give it an AREXX port. Then ANY program can use AREXX to control the driver program. Its VERY powerful and more than just a batch file or just an interprocess control protocol.

>> Full SHELL support.

>Must I name the number of Shells avaiable for the ST?

yes, but how many come AS STANDARD with the OS? The shell is available on all Amiga desktops (unless you delete it of course!)

>(all in all, I must say, quite a reasonable post on your part, Gavan)

Well, when people ask for educated comparisons I`m happy to help. makes a change from people making stupid, unfeasible claims and then being annoyed when I point out that they`re not possible.

>tasking? Now you do mention it you dig yourself another hole, ever heard
>of semaphores? As for your claim about no program using the DSP for
>FP maths, you obviously haven't seen some of the falcon fractal programs.
>Gavan you really are a mindless unknowledgeable Moron.

And you said initially 8 times faster for FP mults... Where are the C
FP libs to use the DSP for this then? The problem is that when you start
using the DSP in this way all sorts of problems will happen if other tasks
are trying to use the DSP too.

No I havent seen the Falcon fractal programs. I did see some progs on
the NeXT which used the DSP for fractal drawing though and they were
impressively faster than the CPU so I suppose the DSP is useful if you
want to draw fractals a lot.

>The DSP can outperform a 16mhz 16030 at just about any task. Even if it
>was a really crap algorithm which was awkward to implement you would still
>get at least an equivalent '8mips' worth.

So you are saying you could use the DSP to write, for example, a C
compiler or word processor? You could write a modern multitasking OS which
would execute on the DSP chip? Come off it!

>The transfer time is not much of a problem for all but the most trivial
>of algorithms. (the 68k algorithm is more than about 5 instructions its
>quicker to do it on the dsp). So what stuff have you programmed on the
>DSP to justify what you say. Why would I lie? *I KNOW WHAT I'M TALKING
>ABOUT* YOU DO NOT.

If you are processing a large amount of data (and I think doing dual
256colour playfields counts as a large amount of data) there is
undoubtably going to be a DSP to memory bottleneck. A few weeks ago some
guy who really knew a lot about the DSP pointed this out (he`d built a
board around one if I remember correctly) and you claimed that the host
port was more than adequate for any DSP needs and that this bottleneck was
not a problem. I`ve shown that at the sorts of rates you want for your

screen, it is.

>:> HARD WIRED?? Whats that supposed to mean. If you are doing DMA from
>:>the memory it has to be done via the databus (unless you have a seperate

>Its always ON. (you can't turn it off, although some hackers apparently
>found some kludged way of doing it). Answering lots of your questions
>Gavan, doesn't this suggest that I know about these things?

So its neglible because its always there anyway... NOT the same as
having no effect on the overall performance. It will be imposing load on
the overall system bus.

>:> And WHY would I want to do 1/2M phongs pixels per sec? MORE demos???
>:>Wheres the useful software?

>the
>:>programmer?

>The Falcon TOS is to multitasking, it would be possible to do simultaneous
>context switching at both ends (I do this in my tracker driver).

So the OS wont actually provide support for multiple tasks running
`concurrently` on the DSP. Thats a _real_ problem if you are tring to
shift lots of processing over to the DSP. You could try to write your own
management system, but with lots of programs needing large amounts of DSP
main memory you are going to hit problems shifting stuff in and out of
memory all the time. I dont think the resulting performance would be very
good at all.

>:>BTW Still waiting to see what screensize/framerate you claim for your
>:>256DP technique.... I thought you`d already coded it.

>26FPS 320x200 True colour.(wait for my next demo, cue Gavan to slag off
>demo writers)

Hmmm, youre WRITING over 3 megs of memory to the screen from the DSP
(via an 8 bit bus) every second, not to mention having to xfer another1.5
megs into the DSP from main memory - this SHOULD be interesting. Does you

CPU do anything else apart from handle all the memory xfers?? Are you actually writing graphics to both `playfields` or is there just two that are scrolled about a bit over each other?

Gavan

>STATED THIS. Do You Under Stand? Earth to Gavan...

YES THEY HAVE. I really wish there was some sort of archive of past
posts so I could show some of the claims that certain advocates have made
here in the past, but there isnt. I remember RT and others STATE BLUNTLY
that there was NO SUCH THING AS A 1 MEG FALCON.

>As for including any memory, you are right - that is a little silly.
>But quite simply, the base Falcon config is 4/80. How many people out
>there have a 1MB/no HD Falcon? Answer = NONE.

Hmmm. So NOONE is using a 1 meg Falcon anywhere? I suspect there are
more than a few strapped for cash ST owners who have bought such a config
and are actually using it till they can afford the memory and HD.

Anyway, as usual the original point has been lost in all the
squabbling. I pointed out that since 1 meg is the lowest config then
anyone with a 4 meg/hd falcon was actually opting for a higher config
machine and so this should be compared to a higher than min config A1200.

The fact that you CAN actually use a cheap, min configed 2 meg chip
only A1200 usefully is a major point in the Amigas favour. The Amiga has a
very compact, efficient OS so you can actually do things with small amount
of memory. I could even multitask on my old 1/2 meg A500 and run simple
WPs and paint programs. Of course, for more advanced use you need fastRAM
but its still cheaper than getting a Falcon.

Gavan.

Ever heard of DMA ? No ? Well the DSP can put stuff striaght into main memory
with no help from the 68030 at all... just use the neat connection matrix and tell
it to connect DSPXMIT to DMAREC and that's it... so simple when you find the
facts out _before_ you open your mouth...

What do you mean "yet"?

All Atari ST/TT/F030 computers has got a linear memory
and can buffer as many displays as the memory can hold.
Otherwise it would be VERY hard to do flicker free animations
and scrolling, don't you think?

Are you for real ?

The GEM desktop isn't better than the Mac Desktop.
The GEM desktop is DIFFERENT FROM the Mac Desktop.

Some people prefer the GEM desktop, and some prefer the Mac desktop.
As it is, i think I'd like the mac desktop better than the GEM
desktop - but that may be because I have used the mac desktop so little
(haven't discovered its' annoying features yet :-).

For the record, I only own atari computers - a Falcon + a TT and I like
them both.

I'm not up on all the technicals of TOS/MiNT, so I can't really say if
such a thing exists on the same level.

> yes, but how many come AS STANDARD with the OS? The shell is available
>on all Amiga desktops (unless you delete it of course!)

Well, my install iof MTOS is the developer one, which came with a shell. I
don't know about the commercial release. Then again, the average user
(i.e. one who cannot find a free shell from somewhere) usually has little
use for a shell as it is. Most things can be easily done with the GUI
Desktop.

SO it seems that the advantages are ones which I don't consider as part of
my computer-making decisions... I know I don't speak for the world, but
it seems that very few Joe-User types are going to look for all of these things
in order to do basic computing tasks.

>(Yeah, I have them)

I quote from STart summer 1988, from their "3 Yearsd with the ST" article.
"The version of GEM first demonstrated to Tramiel Technology was actually
running on top of CP/M-68K... Atari would continue to plan for it to be the
ST's underlying operating system in the months to come."]
Then later they quote Leonard Tramiel:
"CP/M-68K had been around several years; it was a well-known, well-understood
relatively well-accepted operating system. GEMDOS was a completely brand-new
untried, untested, incomplete operating system. However, it offered
significantly higher performance and gave the full hierarchical file system
that CP/M 68K simply did not have. It was quite a difficult decision to make,
but I think we went in the right direction going with GEMDOS."
and right aftert that in the article. "GEMDOS, while not written as an MS-DOS
clone, nonetheless was modelled on MS-DOS. There is nearly a one-to-one
correspondence between GEMDOS operating system calls and those of MS-DOS"

Is that enough evidence for you?

>|> that GEM is far better than the Mac Desktop anyway makes that point irrelevant.

That's the worst part of the STs. I do play games, and constantly changing between mouse and joystick for Steel Empire just got to be too much for the mouse port and I had to run a hot soldering iron across all the connections or else go without a right mouse button. The Mega's are nicely place, though. But it can also be fixed by buying a $15 mouse master (which I did right after the soldering bit).

You must be confusing this with the initial Falcons, which all were
4/80 machines - the 1/0 models were announced at the same time, but
were hard to get for awile.

But no-one has ever said that no such model existed!

>

Perhaps .000000001 % of all Falcon owners might for about 10 seconds
have such a config. A statistically insignificant number, so I still
hold by my claim.

> Anyway, as usual the original point has been lost in all the

>

Just as the fact that you CAN buy a 1MB Falcon and then add the 16MB
and 1GB HD is a plus.

And I wanted a DSP to play around with - which has a cost of infinity
on the A1200, making the upgrade substantially more expensive!

Also, who can measure the true cost of having standard ports for many
things vs. having cards that may or may not bring incompatibilies?
The Amiga may be better than the IBM at this (how could it not be?
Damn IRQ's!), but the issue still is there.

I have heard somewhere of some C compiler doing just this, but I have
no idea if it is true or not - as you know, there are only so many
Falcons around, so somthing like this would take some time to come
around. I know I don't have time to work on such a thing!

Or see JPEG's fast, or see MPEG's fast, or do sound processing, or use
your Falcon as an answering machine (there now is shareware software
that does just this!) and so on.

I personally do not see what is the big deal about the DSP not
multitasking. Sure, it would be nice - but the OS provides support
for using the DSP as a resource, with any program that needs the DSP
locking it for use. Other programs that want/need the DSP can then
send you a nice message about this...

After all, why are you not incensed that your printer does not
multitask? Do you demand that you be able to print two documents at
the same time with interleiving lines?

It seems like you are trying to turn the DSP (an asset) into a
liability.

But even now, some graphics processing packages are coming out that do
have some DSP modules. While I have not the time to do so, I would
like to port some of the more intersting PBMPLUS progs (like the oil
painting effect, forget the name) to use the DSP.

While there still is not much software out there that does much of
consequence with the DSP, that does not mean it is not possible or not
being worked on.

Absolutley right - the 560001 is not really made with multitasking in
mind (though it could be done). It is to be treated as a resource...

>different (i.e. written new from the ground up) OS and not a port!

Thats not what the Atari magazines were saying at the time. I owned an 800XL and the mags were going on about the ST having a version of CP/M 68K rewritten for the ST (ie TOS). At the time the PC still wasnt totally dominant and CP/M 68K was still a going proposition. The mags were making much of the fact that TOS would be able to run generic CP/M 68K progs and that you would supposedly be able to run generic GEM applications too.....

>And the "mac-wannabe" line is just pathetic. PC Gem was hampered by the

fact
>that GEM is far better than the Mac Desktop anyway makes that point
irrelevant.

GEM better than the Apple desktop!? Dont make me laugh! I may not be overly fond of Macs, but one thing that they do have is a damn good desktop GUI. GEM was always desgined to ape the MAC, but it never even came close. Remeber the `JackIntosh` label - ha ha. If only they knew how it would sink without trace. Those were certainly heady days alright. Even _I_ wanted an ST at the time....

This has been mooted since day 1 of the Falcon release. What DSP modem software is there?

>Graphics
>3D rendering
>Desktop publishing

Where are all of these packages then? In fact, impressive as is the list youve mentioned, I see little evidence of software implementations of most of the items.

I take your point that the abilities of DSP have potential in more than just straightforward digital processing. It still doesnt justify the claims that the DSP is better for everything though.

Yes, the fast JPEG viewing is good. As for MPEG well, 1/4 screen at 15FPS is hardly ..fast.. viewing. Its an impressive demonstration of DSP processing muscle but totally USELESS. MPEG needs to be viewed full screen, at 25FPS with sound. Thats what it was designed for. Noone is going to sit and watch an MPEG movie on a falcon. If you want MPEG then get a CD32, 3DO or PC with ReelMagic (or maybe a Jaguar CD when it ever comes out).

Still, if the Falcon ever gains a base of software on CD then it might make a good video player for games or multimedia. But then again , CDXL already matches this size/frame rate with sound on the Amiga...

Well, because with Griff advocating the use of DSP for this, that and the other it means that you cant just start shift your processing to it because once you start to multitask, the whole system falls apart.

I agree its a good resource, but lack of multitasking means its less than suitable for general processing. Its certainly NOT a liablity, it is in fact a good Falcon selling point. However, lack of software support means that many will disregard it.

>While there still is not much software out there that does much of
>consequence with the DSP, that does not mean it is not possible or not

Who is going to buy a system that doesnt have software which uses its strongest point - apart from die hard Atari addicts that is. How many people advocating the Falcon here DIDNT have an ST/TT before? Very, very, very few people have been attracted by the Falcon, who werent just looking for the latest Atari system.

I know _2_ ST owners who sold their STs and upgraded to A1200s, I`ve never heard of a single person who sold an Amiga/PC to get a Falcon.

Gavan.

the
>facts out _before_ you open your mouth...

Oh goody, MORE DMA. Well, I`ve already found out about the `Sound DMA`
but you seem to be saying that there are even more DMA channels that can
be routed to the DSP.

OK, so far I know about the `host port` - apparently 3 megs a second
thruput if you use custom routines (but it has an 8 bit width - that means
lots more cpu transfers than strictly necessary), this isnt DMA.

Plus there is this `sound DMA`, something around 1, 1.5 megs a second
which can supposedly be rerouted.

Now, assuming you hold an entire playfield in DSP memory and the other
in main CPU memory AND assuming that you dont need to be writing to either
of the playfields then you have to stuff 1.5 megs in and get 3 megs out
every second. Thats _just_ within the limits mentioned (assuming that
there is guaranteed zero contention) but it totally ties up your
processor. In fact, I wasnt aware that a 16Mhz 030 could transfer 3 megs a
second if it had to do it 8 bits at a time. You are out of luck if you
actually want do plot any graphics on either playfield after you start
combining them and pumping the results to your 65k colour screen.

Still, maybe there is yet another DMA channel that can be utilitised
to stuff data in/out of the DSP. Please elaborate.

Gavan

: to 2 million now?) Amigas. Thats still a reasonable market, yet Atari
: software sales are on a par with C64 sales!!!!! (1-2 % of the market)
: whilst Amiga sales are up there with Sega (23-24%). Why? because all the
: stupid Atari owners killed the software support for their machine by
: widespread piracy. And they have the cheek to call Amiga owners pirates!

Well, piracy killed the Amiga over here. As for Atari owners being stupid,
I think you're just suffering from Atari envy. Who cares about sales of
Atari in the UK? Likewise, who cares about sales of the CD32 here in
America. I think the CD32 is a nice game console, but it hardly compares
to a Jaguar which is less expensize.

Unless Commodore has a dramatic change of heart concerning their
marketing strategies, I think the Amiga wil die out within a few years.
The UK will soon become like America, where the Amiga only holds a VERY
SMALL niche in the video market place.

In a previous article, gmoran@nyx.cs.du.edu (Gavan Moran) says:

>
> I take your point that the abilities of DSP have potential in more
>than just straightforward digital processing. It still doesnt justify the
>claims that the DSP is better for everything though.
>
Read that message again! No the DSP is not better for everything
else (because it is not a CPU and is not treated as such in the architecture)
The point is that it has A LOT of potential uses which would otherwise be
either impossible or impractical to do with a CPU. There are MANY things
that the CPU can do better than the CPU; look back at some of Griffs
messages and read mine again. It is a coprocessor but MUCH more powerfull
than something like the copper or other blitters or sound/video coprocessors.

As someone pointed out in a previous post, you seem to be trying to make
the asset of a DSP appear as a liability which is utter nonsense.

Before you say it again, everyone here knows it cannot be used to replace
the 68030 because it does not have the capability to be a genereal purpose
CPU. There are many things that it CAN do MUCH!!! faster than any
Motorolla CPU.

I am not going to bicker with you about how much software is available
that takes advantage of the DSP; there is a reasonable amount out there
and much more on the way. The problem is (as you have pointed out MAY
times) that both the user and developer base for the Falcon is pretty
small. It will therefore take some time before we get more DSP aware apps.

There are a lot of shareware programs that do take advantage of it but
again you have to remember that it takes TIME (especially for recreational
programmers) to learn how to use the resource well.

If you had one in your A1200 I am sure you would be tootn' your horn as well
(amd you would propably see more software developed for it too).

But you do not have one :)

:>the
:>>facts out _before_ you open your mouth...
:>
:> Oh goody, MORE DMA. Well, I`ve already found out about the `Sound DMA`
:>but you seem to be saying that there are even more DMA channels that can
:>be routed to the DSP.
:> OK, so far I know about the `host port` - apparently 3 megs a second
:>thruput if you use custom routines (but it has an 8 bit width - that means
:>lots more cpu transfers than strictly necessary), this isnt DMA.

Look Gavan, you have no idea about the Falcon, the HOST PORT has a 24bit
h/ware register for communication to the DSP. You can read/write either 8,16 or
24bits at a time to this register. The fact that the parallel datapath is
8 bit is transparent, just like a scsi interface with an 8 bit path is.

> [stuff deleted]

>processor. In fact, I wasnt aware that a 16Mhz 030 could transfer 3 megs a

Does anyone know how much CPU time and bandwidth AFM eats up on a Falcon?
Does it use the CPU at all for any of the effects? (graphic equalizer,
flanger etc.) I leave it active while I'm doing GEM stuff and never
noticed any slowdown...

thanks

I wrote the above, and I'll stand by it. I was comparing my Falcon030 against the 486dx2/66 in school, which has 8Mb RAM and uses a Trident 1Mb card. I have no idea about bus-systems and such, but Windoze is PAINFULLY slow, and only catches up to the Falcon in 1024*768i*256. (In all lower resolutions the Falcon is faster).

You may have a faster PC, I don't.

Wrong, most Atari 8bit users got Amigas, and C64 owners got Atari ST:s. (In Sweden, I don't know what happened where you live though)

The Amiga's design is much closer to the Atari 8bit.

GM> Maybe I`m just too optimistic but it seems that piracy is on the wane
GM> on the Amiga - attitudes are changing. Plus CD32 means that more Amiga
GM> stuff is coming out on CDROM which will help cut piracy.

WHAT? .. Geez ... You like to talk about the big Amiga market .. yeah sure, of those 260000 A1200's you can bet that only 1 out of 100 buys his software ....

(Out of the "35000" Falcons I can promise you that figure is much higher)

Actually I convinced a friend of mine that developing hardware/software for the Falcon can make bigger bucks than on the PC/Amiga ... less competition and users willing to shell out money ....

Gavan, I'd like to see your AMOEBA have a desktop at 1600x600x16 colours, like I can have on my Falcon with SWABS. I can then quite happily play an 8 track mod file at 50 KHz in the background in stereo and have a raytraced picture being done which only takes about 10% longer to draw. And thats without any extra hardware, only using the DSP to process the sounds. Hardly any serious bus contention at all.

Also DMA mean DIRECT MEMORY ACCESS Ok. On my micro electronics course, when a DMA device accesses the bus it does it while the CPU is executing its instructions and not during memory access by the CPU. As the CPU accesses the memory at a max speed of about 12.5MHz on the Falcon and the DMA at most will only require 400KHz contention is a very very very minor thing indeed. At most only 2% of access(with continual access from both) of the bus time should be in contention.

Read some more books on DMA access Gavan, and start stating instead of guessing okay.

P.S.

Griff, I myself was thinking about writing a Demo of some kind (Or game) for the falcon I have written a few for the STe but have not bothered to give them out. I'm very interested in the DSP though. Have to wait till my exams finish though. Oh well.

Jon

I am not saying it isn't a great game. All I am saying is that it doesn't deserve a 'GREAT AWARD'.... you might be drooling for it perhaps because the Jaguar has about 4 games out? (5?)

|>
|> >
|> > Alien vs. Predator is the type of game I would expect to get an
|> >award, not TEMPEST XXXXX.
|>
|> Yeah, but I think it was not nearly as finished at that point - hate
|> to give best game to a demo!

Yep.. but I hate to give a best game award to a variation of a *very* old game. Hey, what about giving the award to Space Invaders 3000?

|> > So I wonder how reputable where the sources who gave the award
|> >at least for the 'best game.'
|> >
|>
|> Very reputable, from many sources.

Many? Is that many awards then? Please specify....

Sorry Kendall, I like the Jaguar too, but I don't think that Tempest XXXXX deserves that best game... particularly when that game is doable by 'non-64 bits' systems...

Oh, yeah right. Griff, I am surprised you say this. 800x600 looks
far better than the 16-bit 'true color' of the Falcon. Consider
64k colors vs 262,000 colors with a 24-bit palette....

1339. Worst part of ataris

Newsgroup: comp.sys.atari.advocacy
Date: 1994-03-11 04:03:01 UTC
From: quinlan@gemini.csil.sfu.ca
Message-ID: <quinlan.763358581@sfu.ca>
Source record: 17990

You know what the worst part about an atari is? They are practically
valueless after you purchase them. I'm buying a power mac this month
(sorry guys but 601 vs 68030 just doesn't cut it) and I'm trying to
get some extra cash by selling my ST. I know that the ST is an old computer
but I should be able to get the same price for my atari as for my mac plus.
The atari is actually NEWER than the plus and it will only fetch $100
(from a guy who will take it apart) while the mac will get me $200. They are
identical configs and the mac gets 2x the price! This is due to the fact that
very few people know about or like ataris. In a year or two when better
computers are available (atari or not) you may find your falcon valueless.
I know that it will serve you well for now but it would be nice to get
something for it later.

But it is "neat", if useless. When you come down to it, many of the
things we do on our computers are useless - like sounds attached to
keystrokes, or pictures in the background. That does not mean they
are no desireable.

>

Why? Why? Why?

All it means is that one thing at a time can be using the DSP, not
that "the whole system falls apart". And if you were using the DSP as
a math co-processor, then you could have multiple programs use it in
that manner (syncronizing access with semaphores, or whatever).

In fact, there is a JPEG module that does just this - once loaded into
the DSP, the DSP becomes a nice JPEG decoder (well, partly at any
rate) and any program that wishes to can use the DSP in this way -
that's why it is a resource.

> I agree its a good resource, but lack of multitasking means its less
>than suitable for general processing. Its certainly NOT a liablity, it is

What lack of software support? FOr D2D, there is no lack. For almost
any other thing you want, there is at least something using it. The
only applications I would like to see on it that I have not are the
software modem (Hey, 2400 should be easy if nothing else), and voice
recognition.

And I have heard accounts of movement from the Amiga side to the Atari
side as well. This type of lateral movement shows nothing...

Why are not more Falcons around? The reason is simple:

1) No advertising
2) No mail order possible for the longest time.

It follows that mostly Atari people would buy Falcons - how would the average PC owner even have heard of one?

I do think however that the Falcons musical capabilities are selling it in that market.

Is that a new sort of vise? Is it a table vise, or a kind of pliers? :-)

Sorry, I spell poorly myself, but could not resist.

Besides, if you really are looking into the future, you'll wait for the PPC OS/2 box. As far as I am concerned, it is nothing short of criminal to buy a system meant to be as open as PPC, and have Apple propritorize it.

And taking another look at the future - will Mac software run under Pink? I'd be taking a hard look before buying into an OS that does not even really multitask in this day and age.

Sounds like you really haven't thought about the future very hard yourself.

True, I didnt know that the host port presented 24 bits to memory. When
I saw the 8-bit pathway it looked like it gave an 8 bit register to
memory. Still, 3 megs a second need to be transferred to and from this
port by the CPU and it will have to do it 16 bits at a time (here, the
limitations of the CPU databus come into play). I dont believe you will be
able to do this in a 320x200x65k colour mode. A while back you boasted of
being able to move 1.5 megs a second in colour mode so unless your CPU has
suddenly got a performance boost, OR there is another DMA channel you can
use (like I asked about) then you wont have any processor time left.

>>processor. In fact, I wasnt aware that a 16Mhz 030 could transfer 3 megs
a

The Mac Plus cost more than the ST. And if you're worried
about what your comuter "investment" is going to be worth in a
few years, maybe you should stay away from computers for good.

Actually that sounds like a really bad habit to get in to anyway. But
having said that, you can do it with Multitos very easily.

: >all stored as uncompressed images on CD-Roms, which allows for much
: >quicker display speed.

: ever heard of PHOTO-CD?

Yep, wow, that's some multimedia application. Start naming people who actually use Photo-CD. They're so bloody expensive, only Kodak seem to be trying to push it with all sorts of freebies, free developing, half-price CD's. Pity nobody justifies the upfront cost of a Photo-CD player.

Also, I think you'll find that they're not stored as JPEG. Well, not the whopping great big Kodak was passing around as demonstrations of the picture quality of their Photo-CD images. If they were JPEG, I'd expect 10x the number of pictures they're currently storing on each CD.

: >Why not ray-trace and display in 24bits? Why the clunky 24-> 16bit
: >conversions. Most new PC's nowadays don't need this hack.

: 24-> 16BIT conversion is far less 'clunky' than conversion to HAM8, don't
: write such crap please.

PC's don't use HAM8, my Graphics Ultra Pro doesn't, nor does the /w32i in my neighbour's box. I have used the 24bit->16bit quick and dirty stripping when viewing big JPEGS.

: >: I expect the Amiga gfx used in the ITV chart show are in HAM8 (laugh) ;-).

: Seaquest etc, then you contradict yourself by slagging down the Falcons
: capabilities on a TV. 800x600 16 bit true colour beats HAM8 on a TV
: anyday.

Pot Kettle Beige. You contradict yourself by slagging off the Amiga. I'd be suprised if the Falcon ever makes it into the mainstream desktop-video market. Name one TV show that has cool effects down by Falcons.

800x600x24bpp @72Hz NI beats your falcon.
1024x768x16bpp @ 76Hz NI beats your falcon.
1280x1024x8bpp @ 76Hz NI beats your falcon.

This is a medium-level PC video card, which is about 23 years old.
There are lots more with much better resolution, more VRAM, higher
refresh rates.

Where are all the Texas Instruments based 24bit, 4MB RAM graphics
cards for the Falcon? Where's the 68040 falcon? Even the Amiga
has those.

: RH> Yep. About 12 magazines here they don't even mention ATARI because
: RH> "what's that".

: Name them.

Australian Personal Computer
Your Computer
Byte
PC Magazine
PC Week
Computer Shopper (US)
PC Format
PC Review
PC World
Unix World
Windows Sources
Amiga Format

There's 12 magazines, most of the PC based, one's obviously and Amiga magazine. I think you'll be hard-pressed to find anything about Atari in any of them, or Commodore for that matter. Is there an ST section in the UK version of Computer Shopper, as there was an Amiga section.

I'll go down to the newsagent and list them all if you want. I don't get any Atari magazines at my two local newsagents, the Australian Atari magazine, GEM (something or other) folded many years ago. There's at least three Amiga magazines produces locally (Australia/New Zealand). There are a few Acorn/Archimedes magazines around though, sold through the local newsagents.

|> Master Rickard...
|>

Sorry as well since I sure don't remember anyone claiming it did not exist. Would be nice if you could back this claim up with some quotes of what was actually said. Yes the base model is the 4/80 (meaning that everyone, particularly developers, expects the users to have at least 4/80) but that does not mean lesser configs do not exist. They are sold with an expectation that they will be upgraded to greater than base config or if not then you can not expect to make use of the Falcon software developed with the 4/80 base config in mind. And yes there are still many programs that could be run in a 1/0 or 1/x config if you really wanted to do that. Some of you guys read so much into a post that you make more out of what was not said that what was said.

Have you seen T2K? Have you played T2K? If not then how can you make any judgement on the game? It may be an old game, but I understand it has a lot added to it (like different versions) and it was a great old game so why can't it be a great enhancement of an old game. You sure seem to be nit picking on the negative side even though you claim to like the Jag. I have not seen the game yet (on order though) so I am not claiming it is good or bad until I play it.

True, although there are far more from ATARI to Amiga than Amiga to Atari...

|>
|> Why are not more Falcons around? The reason is simple:
|>
|> 1) No advertising
|> 2) No mail order possible for the longest time.

Let me give you the #1 reason:

Price. The Falcon's price puts in on Par with a 486 machine... which
generally speaking blows the Falcon away in normal tasks + has far more
support than the Falcon.

[stuff deleted]

|> I do think however that the Falcons musical capabilities are selling

Listen and read and listen everybody:

I AM SICK OF BEING TOLD I AM NITPICKING ON THE NEGATIVE SIDE OF THE JAGUAR

OK?

I *DO* LIKE IT, AND MAKING A GOOD CRITICISM ABOUT IT AND SOME SUGGESTIONS
AS I HAVE IN THE JAGUAR MAILING LIST SHOWS I WOULD LIKE THE SYSTEM TO DO WELL
OK?

TEMPEST 200XXX WHATEVER IS LIKE A SPACE INVADERS 3000XX ,ETC.

I DON'T THINK IT IS THE 'KILLER' GAME, EVEN IF IT IS WELL DONE.

THE CONCEPT OF THE GAME STAYS MORE OR LESS THE SAME WITH A LOT
OF BELLS AND WHISTLES.

What I would like to see?

* A good Star Raiders - because it's really an awesome game

* Alien Vs Predator (well done) - shows the Jaguar caps and the concept
is awesome

* A near or preferably IDENTICAL version of Mortal Kombat II... In my
opinion this last one will be the Jaguar's "killer application"

even though you claim to like the Jag.
|> I have not seen the game yet (on order though) so I am not claiming it is
|> good or bad until I play it.
|>
|> RandyH

So now, would people realize that difference in opinion != I dislike
the Jaguar?

To change, someone has to first recognize what's wrong. If you can't
face it, you'll never change, unless "a mutation occurs" ;-)

|> >ARM3.
|>
|> I've never heard so much *rubbish* in my life. Have you any idea how fast an
|> 040 or ARM 3 is? A cookie cut (masked sprite) blit is one of the most
|> complex blits that can be done, how come both processors could do it 3 times
|> faster? (come on Mr Brown, admit you are wrong).

3 times faster? I think not. In a previous post you mentioned that you could clear memory just over twice as fast using an ARM3 than the AGA blitter (you never mentioned wether the blitter was in nasty mode or not, and if it wasn't, then it would have been twice as fast as you were posting). Now using the blitter to fill memory takes as many DMA cycles to finish as a single source blit, ie the blitter is the same speed for a blit as for a memory fill (barring bus contention). If the ARM3 is 3 times as fast on copying as you claim, then could you explain why it is only twice as fast for a memory fill, which is a much simpler operation than bit blitting, and takes the same amount of time to perform on the Amiga's blitter. Now who's talking rubbish?

|> :>I doubt very much that all games go through the operating system, and if they
|> :>stick to the ECS registers and are written well, this is not a problem. Anyone

|> There is a lot of public laughing then. As I said you live in a DREAM-WORLD.

No, I live in a world where people write software that actually WORKS on machines which have a slightly different hardware configuartion. If everyone wrote metal bashing illegal software as you mentioned, then they would go bankrupt pretty quickly.

|>
|> :>The operating system is there for a reason. It was written by people who know
|> :>what they are doing. A lot of sensible games programmers DO use it. Take Frontier
|> :>for example, that even multitasks!
|>
|> Frontier is not AGA enhanced as far as I know. What fast-action AGA games
|> uses the OS then ;-) ?

Anything that runs on the CD32 for starters (which currently has the majority of AGA games), since it uses lowlevel.library which allows programmers to access the

hardware in an OS-legal way. Other stuff (all of those Maxis Sim games, for example) runs on an intuition screen, multitasking under AmigaDOS. We are not living in 1987 any more you know. BTW, an AGA version of Frontier is in the pipeline according to david Braben, as well as a CD32 version, which runs as fast on the CD32 as the original Forntier does on an A4000-040, and includes the texture mapping that the PC version has.

|>
|> Seriously on a friends A1200 Frontier is pretty slow and jerky.

It's not too bad if you have 32 bit fastram. Frontier is a lot slower than it could have been, because it's written so that it will run on 68000 systems, and is therefore not fully optimised for 32 bit Amigas. the forthcomming CD32 version is supposed to be a lot faster for this reason. (Ah, the joys of having a 16 bit past :-))

INFO ABOUT GOOD MIDI SEQUENCER/TRACKER PROGRAMS WANTED!

Is there any MIDI sequencing software available for any Atari system,
that uses a editor like the one in the Pro/Sound-Trackers on Amiga? After
owning a multitimbral MIDI synth (without any serious software) for soon two
years, I'd like to get into some real music writing.

Until now I've been using my Amiga 500, and tried programming a cool MIDI
sequencer/tracker of my own but I have never had enough time for finishing
the program, and, I've realized that the 8 years old machine *is* too slow
for any serious work. So now I've decided to upgrade, either to a newer
Amiga or something completely different, like an Atari.

As I said, I'd like to work with a track-editor that works a bit like the
one in the good old Trackers. I don't care about notation, nor piano-roll
editors. Of course the empler
yet. I want *at least* 32 tracks to work with (the synth's got 32 voices).

So give me some advice. Recommend any good software you know, and tell me
what kind of Atari I need. I'm really looking forward for some serious
music-making!

Thanks in advantage,

Mathias

It's a pretty close thing I'd say. GEM on the ST looked pretty dire. I've seen a little bit of what it looks like on the Falcon, and from the little I saw I wasn't terribly impressed. I have an intense dislike of the Mac GUI, which I find to be clunky and intrusive almost to the extent Windows is. On the other hand it does look a bit nicer than GEM.

AFM connects the sound in to the DSP, and DSP to sound out ..... all the
effects etc are done using the DSP, and takes no processor time whatsoever.

However, the main AFM program (graphics etc) do use the CPU.

:>|> >The 68040 can word blit faster than the AGA blitter, but it cannot bit blit
:>|> >faster than it, hence the blitter would still be faster than the 68040 for a
:>3 times faster? I think not. In a previous post you mentioned that you could
:>clear memory just over twice as fast using an ARM3 than the AGA blitter (you
:>never mentioned wether the blitter was in nasty mode or not, and if it wasn't,
:>then it would have been twice as fast as you were posting). Now using the blitter
:>to fill memory takes as many DMA cycles to finish as a single source blit, ie the
:>blitter is the same speed for a blit as for a memory fill (barring bus
:>contention). If the ARM3 is 3 times as fast on copying as you claim, then could
:>you explain why it is only twice as fast for a memory fill, which is a much
:>simpler operation than bit blitting, and takes the same amount of time to perform
:>on the Amiga's blitter. Now who's talking rubbish?

I'll just repeat what you said:

>|> >The 68040 can word blit faster than the AGA blitter, but it cannot bit blit
>|> >faster than it, hence the blitter would still be faster than the 68040 for a

DO YOU STILL STAND BY THIS?! I THINK NOT, ADMIT YOU ARE WRONG
(PS. I WAS WRONG ABOUT CLEARING MEMORY IT CLEARS MEMORY 4 TIMES QUICKER!).
Can't you understand that with a RISC chip it is only the memory transfer
which takes the most time in a logic operation, with the ARM3s inherently
faster bus it can thrash a AGA blitter. The same goes for the 040,
if the AGA blitter is better than an 040 why is commodore making a new
one for AAA? You are silly to compare 040s and the like to crap 16 bit
blitters (cue bollox about increased bandwidth blah blah blah).

:#Have you seen T2K? Have you played T2K? If not then how can you make any
:#judgement on the game? It may be an old game, but I understand it has a
:#lot added to it (like different versions) and it was a great old game so
:#why can't it be a great enhancement of an old game. You sure seem to be
:#nit picking on the negative side even though you claim to like the Jag.
:#I have not seen the game yet (on order though) so I am not claiming it is
:#good or bad until I play it.

I still remember back a few months ago when there was discussion about
Jaguar games when the Jaguar just came out. A few posters were saying that
Jaguar games were going to be all of these new games and not just ports or
enhanced games, yet here I see people raving about a Tempest port.

These same people are the ones that were saying that the CD32 games were
all ports. Let's see a game for the CD32 that's a port is just so-so, but
a game that comes out for the Jaguar that's a port is considered to be
great. Hmmm...

Well if you are talking about GEM in anything less than 640x480x16
on a VGA then it is not going to look terribly impressive. BTW I've seen
your desktop (I assume it is a pretty recent version; I think '92 right?)
and it is very nice but not nicer than mine:)

Both your Amiga desktop and my Falcon MTOS desktop are nicer than
a MAC IMHO.

BTW GEM on an ST means you were looking at one of these:

320x200x16 (useless IMO)
640x200x4 (it was usable back then)
640x400x2 @72Hz (OK, very nice picture but obviously only mono)

The changes between the old TOS and GEM and TOS4.04 w AES4.1 are ENORMOUS!!

No, I am seriously drolling over it 'cause it looks like a great game!
Same with AvP. If this were some sports title (which I don't care for
much), then I wouldn't be drooling over it at all.

You should read reviews of this game - the music and graphics are said
to be incredible, and finally showing what the Jaguar can do.

It is however true that the software path is slow. It is heartining
to see that a lot more developers are signing on though!

No, it is an old game concept with a lot of new features and gameplay, making it almost an entirley different game - like not being able to see the whole drid at once, powerups, being able to jump off the track...

And when you come right down to it, how many really new games are there out there? TE for the 3DO is really just Starfox with some extra stuff. What game should have won the award?

Ah ha, well I was going on about the Sound DMA channel. I had assumed from the way you implied the 030 was handling _all_ memory transfers that you didn't know about it... Still it can be used to take a lot of load off the 68030 when transferring to/from the DSP although I would imagine it's not enough for True color screens...

^^^^^^^^^^^^^^^^^^^^

How can you be British and not know what a wanker is? Do you ever go
to sporting events? Soccer/Football, Cricket, Rugby?

It's a common chant amongst spectators, it was really big when Sir
Richard Hadlee was still playing cricket, 100,000 people chanting
"Hadlee is a wanker", cha-cha-cha (sounds of people stomping feet,
banging display boarding on the bounardy fence). Magical crowd
participation in Bay 13 at the MCG.

So what other chants are popular at the Football and Cricket matches?
I can never hear what the Europeans are chanting properly. The cricket
matches usually have all sound except the commentators filtered out.

I don't think that is what people were saying. I believe it was something
along the lines of "They're just going to be Amiga 500/1200/etc.. games
with extra levels and music.", not "They're going to be re-makes of yet-
to-be-seen-on-the-Amiga games.". I mean, 90%+ of all games out there
are just remakes of old games anyway. Hard Drivin' was one of the first
arcade games to really put you "inside" a car, but just check out Ridge
Racer or Virtua Racing or ... Improvements on games are possible, and
they make the game a lot more funt to play. No one is claiming that the
Jag games are all "new and original in concept".
That would leave about two games for the system.

1378. Info on Falcon and TT wanted

Newsgroup: comp.sys.atari.advocacy
Date: 1994-03-12 14:50:40 UTC
From: 912443@brt.deakin.edu.au
Message-ID: <2lso9d$2l0@sol.ccs.deakin.edu.au>
Source record: 18029

I am an Acorn RISC OS user waiting for that ever to be released new mega machine around the corner in mid year.

This is one of those gimme questions in some respects. I don't expect to be wooed away from my current platform, but the Falcon has this mystique about it that originally attracted me to Acorn from DOS boxes a few years ago. Maybe I'm in search of variety and a new learning curve (though a hard disc would probably satisfy me).

Basically I know nothing of Atari platforms post STe and would love to find out more info about the Falcon & the TT (if they still market that). EVERYTHING from custom hardware (esp this amazing DSP chip) to various models to grafix & sound capabilities to the OS and software available (how much have you moved on from that very ghastly GEM/TOS thingy yet?).

If there are any users that can directly compare it to Acorns, unreal, and similarily, any Austrlian owners with prices etc...

If there are standard set answers for this type of question, email away.

Stay Animate
Niraj

PS: I didn't realize the similarity of all us small user base platform users went through (complaints about underspecs, overpricing, lack of marketing ...).

I wonder what chips they are referring to?!? The evr so popular 6845?
The 8088? Or even the 74 series? Oh, wait, it must be the 8245s!

>quinlan@sfu.ca
>"And people also thought that the world was flat"

I hear you on this one! Over the summer, I bought an old Atari
to do MIDI work on. Now granted, this machine has no HD or anything
but its still a decent system, especially for someone who is getting
into sequencing, and has 1 meg, SC1224, etc.. I cannot sell the system
for $200 even as a dedicated sequencer, even though I see people trying
to unload S-50's, QY10's, and all those aggravating hardware sequencers
for sometimes twice the price! Cubase 2.3 is much better, and offers
graphic editing, etc..

Speaking of atari, what's up with the Jaguar. I don't watch
more than an hour of TV a week but I read quite a few periodicals and
I have yet to see ONE ad for the Jag. At least I saw a lynx ad a few
years ago in Popular Science. With $40 million bucks the Jag should
be all over the place, advertising on saturday morning tv, star trek,
magazines etc..

Someone fill me in--

|> track...

Powerups... jump... those are old concepts! I am not denying that the game is good or not (I kind of liked Tempest, but not loved it). The thing is that those things ARE DOABLE on other systems, is not the Jaguar's "Killer App" or "Killer Game". And those things are not only doable, but *OLD*.

|>
|> And when you come right down to it, how many really new games are
|> there out there? TE for the 3DO is really just Starfox with some
|> extra stuff. What game should have won the award?

I haven't palyed TE on the 3DO, but from what I have seen, probably Star Fox and later on (because it came later on) TE. BTW, just because people decide to give an award either to StarFox or TE doesn't mean I agree either with that decision.

|>
|> >|> > So I wonder how reputable where the sources who gave the award

Kendall, I didn't mean that I question whether the Jaguar received
the Tempest award or not... I read it myself too... I was just stating
'how reputable' are the ones 'who GAVE the award.'

|>
|> > Sorry Kendall, I like the Jaguar too, but I don't think that
|> >Tempest XXXXX deserves that best game... particularly when that game
|> >is doable by 'non-64 bits' systems...
|>
|> I wouldn't say that 'till after I've seen the game.

Oh my, let's see: I got a very detailed description of it in the
jaguar list, and I can see nothing there that say, a Genesis couldn't
do , except say for a 24-bit background.... Oh, my, that surely deserves
the award....

|> ---> Kendall Gelner (kgelner@nyx.cs.du.edu)

It's 3.0 using the MagicWB icons. 3,0 was out in 92, yes. 3.1 is due for general release soon.

|> 640x200x4 (it was usable back then)
|> 640x400x2 @72Hz (OK, very nice picture but obviously only mono)

The 640*400 looked nicest IMHO. I must admit that Workbench looks pretty ugly in 640*256, which is what you ran it in on an A500 if you couldn't put up with 50Hz interlaced. The A500+ solved this problem by allowing the user to run in 640*480 72Hz non-interlaced in 4 colours. Of course if you have an A4000 with a graphics card, you get to run in 1024*768 in 256 colours, or higher.. Oh well, we can live in hope.

I saw one of these advertised by Ladbroke Computing recently. I couldn't believe my eyes, 600 pounds for a 1 Meg Falcon with no harddisk. What planet are Atari living on? You can get a 25MHz 68030 A1200 for that. Perhaps they've decided to stop making the Falcon and concentrate entirely on the games console market, which lets face it, is their traditional market, and sell off their remaining machines at rediculously high prices to existing ST users. I can't see any other reason for this crazy pricing policy.

Price is part of it, but I'll bet Falcon sales would have been at
least double what they are now if the two conditions mentioned above
did not apply. Consider that I, who really really really wanted a
Falcon, had to wait about three months before I could convince a
dealer to sell me one! How many other people just gave up.

>all ports. Let's see a game for the CD32 that's a port is just so-so, but
>a game that comes out for the Jaguar that's a port is considered to be
>great. Hmmm...

What you miss is that T2000 is much much more than just a port. It is
almost an entriley new game... It includes a classic mode for those
who want to try the original again, but it also has a 2000 mode that
has many more different enemies, powerups, and things like the ability
to jump off of the playing grid. It also has a two player mode.

In addition to the features that push it far beyond being merley a
port, it also makes extensive use of the Jaguar's graphics and sound.

For what it's worth, go pick up the April edition of EGM - the rate
T2000 as the best game of the month (like they did at WCES, doubt it
now?), and should have pictures and descriptions.

In short, those who claim it is just Temtest are really mistaken.

Richard C. Mills (rmills@ccd.harris.com) wrote:
:#Well, piracy killed the Amiga over here. As for Atari owners being stupid,
:#I think you're just suffering from Atari envy. Who cares about sales of
:#Atari in the UK? Likewise, who cares about sales of the CD32 here in
:#America. I think the CD32 is a nice game console, but it hardly compares
:#to a Jaguar which is less expensize.

I don't know where you are claiming this for but piracy has never been the actual cause for loss of sales. Every platform suffers from piracy and claiming it killed the Amiga someplace is idiotic.

I guess whoever owns or has an interest in the Atari in the UK actually cares what the sales are. Same for the CD32 in U.S.

Jaguar is less expensive until you add a CD player. Also, games of Jaguar has recently been increased in price. Games for the CD32 are still relatively cheap. The Jaguar is more powerful than the CD32 but until more than 5 games are available, it's just powerful hardware.

:#Unless Commodore has a dramatic change of heart concerning their
:#marketing strategies, I think the Amiga wil die out within a few years.
:#The UK will soon become like America, where the Amiga only holds a VERY
:#SMALL niche in the video market place.

Actually, I think C= had better marketing sense than Atari in this round. Let's see C= released the CD32 in Europe where it has name recognition and it's largest user base. Atari releases the Jaguar in the U.S. where they have to contend with 3DO, and their largest user base happens to be in Europe. In the U.S., people are still somewhat weary of what happened with the Lynxes.

If the Amiga happens to die out in a few years, I think Atari will have been gone before then, IMO.

:>|>
:>|> DO YOU STILL STAND BY THIS?! I THINK NOT, ADMIT YOU ARE WRONG

:>Yes, It happens to be true.

Oh please, don't make me laugh, an AGA blitter better than an 040? NAME
ONE OPERATION THAT CAN BE DONE FASTER WITH THE BLITTER. I guess all these
040 coders use the blitter to convert byte per pixel to bitplane NOT!!!!

:>|> (PS. I WAS WRONG ABOUT CLEARING MEMORY IT CLEARS MEMORY 4 TIMES QUICKER!).
:>
:>Really? You quite categorically said that you could clear 200K per frame using
:>the AGA blitter and 500K per frame using an ARM3. When it's pointed out to you
:>that your figures don't add up you change your story. Either you were lying
:>before, or you're lying now.

160k per frame for the AGA blitter, 640k per frame for an ARM3.
so what timings have you done (I used STMIA memory clearing using 13 registers,
On the amiga I used blitter nasty mode and just channel D enabled of course.
what timings do have to back your arguments other than mindless 'oh you
must be lying'.

:>|> Can't you understand that with a RISC chip it is only the memory transfer
:>|> which takes the most time in a logic operation, with the ARM3s inherently
:>No-one is denying that the memory access is the operation which will be the
:>slowest. Yes, the ARM will perfrom the shifting of data and the logical
:>operation insturctions faster than it will perform the memory access
:>instructions.

>The fact remains that a blitter takes NO EXTRA TIME at all for
>these operations. This is because it was designed to do them, and therefore
>has the operations hard coded into it's pipeline.

And the FACT remains that the blitter is a lot slower than a FAST CPU,
an nice easy analogy for you, the Atari Falcon has a blitter to support
its 16mhz 68030, the 32mhz 68030 Atari TT DOES NOT, because using the
processor is faster, an 040 seriously kicks a 1985 blitter stone dead.
(and don't hark on about the AGA blitter its 40% faster than the ECS
blitter MAX, and no faster at line drawing etc).

[crap deleted]

:>|> if the AGA blitter is better than an 040 why is commodore making a new
:>|> one for AAA? You are silly to compare 040s and the like to crap 16 bit
:>
:>What a stupid argument: If the Amiga 3000 is faster than the Amiga 2000 then
:>why did Commodore design the Amiga 4000. Because it's faster again. Not
:>terribly hard to grasp is it?
:>|> blitters (cue bollox about increased bandwidth blah blah blah).
:>Are you denying that AGA has increased bandwidth over ECS? If so then you're a
:>bigger fool than I thought.

Actually I was just taking the piss out of you, a 40% faster blitter in the
1200, wow what a leap in technology. Now who's laughing?

} cards for the Falcon? Where's the 68040 falcon? Even the Amiga
} has those.

Well, Jim, it's not available. However, you could wait a month or so and buy an afterburner ('040 card), then you can plug in any PCI graphics card from the PC world, and have your fantastic graphics on tap. I guess a Weitek P9000 (Diamond Viper is one such, I'm told) would be pretty cool.

Simon.

>*OLD*.

But the graphics and sound associated with said extra stuff may not be
duplicatiable on other systems!!

Sure the concept alone could probably be done on a nintendo - but not
with the same graphics, smoothness, or possibly even gameplay.

When you come right down to it, almost all game concepts are just
peices of old things.

>

>do , except say for a 24-bit background.... Oh, my, that surely deserves
>the award....

I get the Jaguar list too, and it really doesn't detail too much what
appears on the screen and so forth in the 2000 version. What you can
get in the magazine is some nice pictures...

I myself have not sen this particualr issue yet, but I'm looking
forward to it!

>

Nope it works fine on the 1200 I play it on (which has 2mb fastram and still
doesn't run frontier as fast as my Falcon).

BTW Gavan, Stardust is written by a bunch of demo-writers, so perhaps you
should not be so quick to slag of the 'techie' demo-writing type.

Griff

You are right.

|>
|> The only point to all of this bickering is to spread so much shit
|> on the little useful information as to make the entire discussion
|> group useless.

True. Unfortunately, this is an advocacy group :-(But let's say
that I'll try to post more things about Atari stuff I really like, like
say the Jaguar. Problem is that sometimes I have posted some
criticism about it and then people jump on me like I am flaming
the Jaguar just because it's ATARI's property.

|>
|> By far the worst offender is sinclap. You rude jerk, Peter Dickhead.

You are *absolutely* right. The funniest part was last year,
when he bashed ATARI's here using the Amiga, but at the same time
he bashed the Amiga on amiga groups using the Mac.

|> I'm glad you like your Mac. Get the hell off of this group. You

1403. Jaguar News [*LONG!]

Newsgroup: comp.sys.atari.advocacy
Date: 1994-03-14 04:58:00 UTC
From: raist@rmece02.upr.clu.edu
Message-ID: <1994Mar14.045800.23348@rmece02.upr.clu.edu>
Source record: 18054

Well, I think quite a few ATARI users would be interested
in the following and since I agree quite well with TOMM@cms.cc.wayne.ed,
I'll try something new- :-)

This comes from the jaguar mailing list:

------------8x CUT HERE 8x-------------------

O.K...here is what you've all been waiting for. The FULL
scoop on Tempest 2000.

What was our first impression?

DAMN, I didn't know that Joey Wood or Jeff Minter worked
for Future Crew...

This game kicks ass...no bones about it!

You see the title screen and you know this is a QUALITY
game. The music pounds OMINOUSLY in the background, and
you are almost too frightened to proceed. If you dare to
press a button you will be treated to an ATARI symbol
without peer. It flows on a color plasma-type background
resembling an over-head view of a wave. You may choose
from TRADITIONAL TEMPEST, TEMPEST PLUS, TEMPEST 2000,
TEMPEST DUEL.

During all modes of play, you have the option to switch
between a stationary playfied (like the original), a
view which hovers above your cannon, and a view which
zooms up right behind your cannon...not quite 1st
person. In the latter two the rest of the playfield
adjusts to your current position, since not all of it
can be seen at once.

TRADITIONAL TEMPEST is just that, only with updated
sound effects. Nothing much to say here.

TEMPEST PLUS is like TRADITIONAL TEMPEST, only there are
some new options and enemies. You may play cooperatively
with another player, or have an AI Droid fight along
side you (a good way to play, for beginners). The
explosions and enemies are somewhat enhanced, but it is
no 2000.

TEMPEST 2000 is nothing short of amazing. It has a
smooth, colorful, shaded playing field. There are many
added options. You can obtain power-ups which will allow

you to get a particle laser, the ability to jump off of the playfield (which is VERY useful), an AI droid, a warp triangle (3 of which will take you to the warp zone where you have a chance to warp 5 levels), and an "OUTTA HERE!" (which will end the level instantly). New enemies include: Mutant Flippers (much faster than the original), Mirrors (that reflect your shots back at you!), Demon Heads (whose horns cannot be destroyed once shot), and deadly UFOs that hover above your cannon and fire down at you. The only way to kill them is to JUMP over them and fire at the same time! The sound effects are excellent with many channels playing simultaneously (no distortion whatsoever!) If one is skilled enough to pass all 100 LEVELS, the game will automatically switch into "BEASTLY MODE" where the enemies move and shoot faster while you shoot slower--talk about adding insult to injury! (once you make it past 'beastly mode' you have the option to play all your games with beastly mode on.

TEMPEST DUEL is probably the only version of the game on the cart that won't live up to SOME people's expectations. The object is to blast your friend at the opposite end of the web, while at the same time avoiding his fire. The two webs are set side-by-side with player 1 on the left, and player 2 on the right. The position of your opponent is shown by a highlighted track on the web. We found that the playing fields were a little too small which made distinguishing elements of each web difficult. i.e. There were many things happening on the each field at once, and it is all crammed into two tiny webs.

Anyone who does not believe that a cart can play true CD-quality sound has yet to hear TEMPEST 2000. Everyone who observed me playing thought the music was one of my techno CDs. Truly unparalleled sound!

We think that this is the first cart that really shows off what the Jag is capable of. Zillions of things moving at once, yet no slowdown of any kind! You have your pumping soundtrack, your mind-blowing visuals, and just downright amazing gameplay. Any person that loves a good, original arcade game will love TEMPEST 2000. Atari is giving us what we gamesters really want...originality coupled with design excellence--not some rushed-out-the-door copy of an overused concept.

Tempest 2000 is the first game to use the trademarked Melt-o-Vision graphics, most likely developed by Joby Wood and Jeff Minter. These are a must-see, with no words to do them justice.

Our only complaints are the following:

--For true nostalgic purposes, Atari could have left the
traditional sound effect intact for TRADITIONAL TEMPEST.

--It would be nice to play cooperatively in TEMPEST 2000.

--Bigger webs in TEMPEST DUAL

--As an alternate to "kill your opponent" competitve play,
it would be interesting to have Tetris style competition
in which the object would be to achieve a higher score
per level.

Truly one of the most amazing we have played to date.

It includes all of the aspects of a great game, enough to
make TEMPEST 2000 into a classic again!

We hope that you found our review informative and as
unbiased as possible. Please send any questions or
comments, please feel free to e-mail us.

>
>REVIEW!!! NOW!!! :)

Okay. I'm not the friend mentioned above, but I was one of the ten lucky
winners. I don't have a lot of time to spend on this, so let me make this
brief and to the point:

TEMPEST 2000 *ROCKS!!!*

The graphic effects are simply amazing. Have you ever seen one of Future
Crew's award-winning demos running on a fast 486? T2K feels like it was
written by them. For the first time it really seems like the Jag's
power is being utilized. Everything is _so_ smooth and _so_ fast I'm not sure
I can believe it - but then, this is what we all expected from 64 bits, right?

A couple highlights:
(for the Tempest 2000 version - but many apply to the other games)

* _Very_ nicely shaded webs - some have ultra-smooth color-cycling

* Three selections for the "camera": arcade mode (stationary web), default mode (web moves, camera follows you), and zoom mode (slightly closer up version of the previous one)

* SO MUCH STUFF ON THE SCREEN!!! Sometimes it gets rather confusing. You've got the web, all the creatures on it, power-ups you try to collect, zooming/scaling/rotating/morphing text everywhere, a wicked moving starfield background, and more.

* An _excellent_ soundtrack! This is tecno-rave at it's best. By far best music I've ever heard on a home system - and far above most of stuff at the arcade, too! BTW, I don't know what the deal is with that CD of extra music rumor, but I didn't recieve anything extra from Atari. But most importantly, _great_ sound: clean instruments, and very cool samples.

* Lots of little extras, like all sorts of "vector balls" and the incredibly cool Melt-O-Vision (TM) transitions between screens - stuff you've just gotta see to appreciate.

As of now, this is _the_ game for the Jag (IMHO). It blows away everything we've seen thus far in the area of high speed, addicting action - of course, we haven't really seen all that much in this area at all. Even so, I really think T2K will be a "rock" in the Jag's game library - future games may look snazzier, but the action of Tempest is unique.

I almost feel guilty being one of only 10 people who have this game - I hope Atari gets it out to everyone else REALLY SOON!

----8x CUT HERE 8x----

I got the April EGM in the mail today. It's probably the best issue in months. As of the April issue, the Jag has won EGM over. T2000 is "Game of the Month" and head editor Ed Semrad gave it a perfect "10". Quartermann has more positive comments on the Jag in the Q-Letter. There's a multi-page article on the Jaguar CD and some upcoming games, such as Club Drive, Kasumi Ninja, and others. It has the first in-depth coverage of the Jag CD, including pictures. Anybody who uses AOL can read my detailed posts about the issue in the "vs." and "Video Game Magazines" folders. Get the issue! It's the Jag fan's dream issue. Can you believe it? The Jag has won EGM over! I'd be glad to answer any questions for any of you non-AOLers who don't have the issue yet. Great issue! :-) JasonTE

----------8x CUT HERE 8x----------

[Raist again]

I just wanted to comment that the addition of all those developers
in the Jaguar is perhaps one of the best news for such platform.
We'll also have to check of those who signed, who is actually
seriously involved developing something or just playing 'wait n' see.'
At the very least, with just 1/3rd of the renown companies,
I see a good chance for the Jaguar.

I think ATARI has to be ready for this year's Christmas because
it will decide its future. If ATARI can't start by the summer
having eye-popping titles, either 3DO or the Saturn will just bury
it in the U.S. 3DO is lowering its price a lot, probably to
$400 by next christmas and the Saturn has SEGA's marketting and
support. Nintendo's is still almost two years away ;-)

I would strongly recommend ATARI to get Mortal Kombat II in a
99.999999995 % identical translation of the arcade game, in order
to absolutely SELL without a doubt. This game alone will
guaranteed sell the Jaguar big time.

But it has to be IDENTICAL or nearly idindisguinshably identical,
or else people will laugh at the '64-bits' claim...

Oh yes, pretty weird... That it is smooth on a 16MHz '030, that is only
about twice as fast. *NOT*

(the speed comparison also regards the fact that a stock A1200 has no
fast mem, and that the '030 has a much better cache system.)

There are FAQs on comp.sys.atari.st that cover this. The Falcon in particular has very complex audio/video capabilities that would take too long to re-iterate here. If you get really stuck for data mail me at ilaskey@cix.compulink.co.uk where I can take the time for a longer answer.

It IS faster than the ECS blitter. The blitter uses even DMA cycles, and there are twice as many available under AGA (ECS has 1.8 million blitter DMA cycles per second, AGA has 3.6 million). It' still 16 bit, but there is apparently some kind of burst mode available. (Only speculating here, but I imagine that the AGA blitter is used twice per blitter DMA cycle, since the Alice chip transfers 32 bits per DMA cycle, as opposed to the old Agnus chip which only transfered 16 bits per cycle.) You have only to cut a brush in DPaint, or move a window under Workbench to see that it is quite significantly faster than the ECS blitter. (The copper was similarly sped up, and can write registers every 2 low res pixels instead of 8.)

The blitter uses the processor cycles. I have tested the blitter speed myself
and did not manage to reach over 40kB/frame. Please try it out in practical
tests before you claim anything. I wouldn't mind if you were right, though.
However, to the best of my knowledge, AGA blitter performance is only better
than ECS blitter performance in a relative sence - that is, in high-res
screens where the ECS blitter gets blocked, the AGA blitter can still
work undisturbed due to the better band width.

/Kristofer.

I doubt that, since you don't know what you're whittling on about. A brief introduction to utilisation of DMA cycles on the Amiga blitter:

When doing a single source blit, cycles are utilised thus:

a0 -- a1 d0 a2 d1 etc.

(where a represents the blitter reading the source, d represents the blitter writing, and -- represents an unused cycle.) When used in 3 source mode it proceeds thus:

a0 b0 c0 -- a1 b1 c1 d0 a2 b2 c2 d1 etc.

(again, a,b and c are reads, d is the write.)

When using the blitter to fill, the blitter DMA cycles are used thus:

d0 -- d1 -- d2 -- d3 etc.

Which if you notice takes as many DMA cycles as a single source blit. In 320*256 using 8 bits per pixel, this will proceed at exactly the same speed as a single source blit (OK, if you want to get pedantic, a blit wastes 2 cycles, one at the beginning of the transfer and one at the end, wheras the fill doesn't.) If you start using higher resoloutions, then the blit will take longer because the display DMA will be stealing even cycles from the blitter.

Now Mr Griffiths, may I suggest that the next time you decide to make one of your rude, confrontational, and big headed posts you make sure that you actually know what you're talking about, because you'd look a lot less stupid.

Mr Brown thinks that doing a blitter clear (just channel D) takes the same time as a copy op (using channels a and d).
THIS IS COMPLETELY WRONG, a memory copy will take twice as long. A blit using all four channels will take twice as long again. Could some other Amiga coder post and tell Mr Brown that he doesn't know what he is talking about.

It is exactly the same here. NONE of the PC owners I know buy ANY of
their software for their PCs. NONE. It is just like in the old days on the
C64. (they have manuals etc. but it is all pirated). (it is also easy to
buy NEW PCs with hard drives filled with software (pirated of course))

Raist, from what I understand from the descriptions and the little game play I saw on CNN of Kasumi Ninja, it should beat the hell out of MKII. For those who love guts and gore, this is the game to get. One of the developers said that one of the special moves is the ability to pop your opponents eye out!! and there are alot of other nasties.

Rumour has it that MKII will be out for the Jag sometime later on in the year.

So didn't I tell you that T2K was an awesome game?

OK, if it's absoloute proof you want then here it comes. Have a look at 'Amiga Intern', published by Abacus Books, pages 865 to 905 inclusive More specifically look at the timing diagram on page 894, where it can be clearly seen that if bitplane DMA is not stealing cycles from the blitter (320*256 in 16 colours under ECS, or 320*256 in 256 colours, or HAM8 in AGA), then a blitter operation using just the destination channel will take exactly the same number of DMA cycles, and execute in the same amount of time as a blitter operation where one source and the destination channel are enabled. In laymans terms, A MEMORY FILL AND A SINGLE SOURCE BLIT WILL TAKE THE SAME AMOUNT OF TIME. You also may be interested in this quote from the following page, "The table also shows that the Blitter is not capable of using every bus cycle even if only one DMA channel is active."

|>
|> Just to clarify this, I'm not talking about blitter 'ticks', I'm talking
|> about the actual time it takes to finish the op, i.e. if you have a timing
|> bar on the screen when the blit finishes. Mr Brown doesn't seem to
|> realise the difference between theory and practice, perhaps he should

Oh, they'll take the same amount of time alright. There are a couple of video modes where the blit will be slower than the fill (ie the ones that are just below the maximum video bandwidth). These are the exception rather than the rule however.

|> stop reading text books and actually DO SOMETHING.
|> (I lost all respect for him when he said the AGA blitter is 2-4 times
|> faster than the ECS blitter and it outperforms an 040 for 'bitblitting' (laugh).He doesn't even realise that the amiga blitter is a 'word blitter' not a

That's interesting, because you quite categorically stated you could write 160K per frame using the AGA blitter, The thing that's most interesting about this is that the ECS blitter has an absoloute maximum writing capibility of just below 40K per frame. (Do the Maths yourself if you don't believe me, I assure you it's correct.) 160/40=4, so it appears that you, yourself, using your own carefully obtained measurments have proven that the AGA blitter is indeed 4 times the speed of the ECS blitter. (Nothing like shooting yourself in the foot, is there, Griff?)

May I make a suggestion at this point? You seem to have some kind of irrational hatred of the Amiga platform (this probably isn't terribly healthy, hating computers, after all, they're just machines). Now if you want to flame them, then by all means do so, as is your right. However you might look a little more credible if the claims about the Amiga's 'hardware deficiencies' were actually coherent between posts (ie your arithmetic seems decidedly dodgy), and you didn't resort to personal insults when relpying to posts that contained entirely correct and factual information. I know you'll probably ignore this and continue to make a fool of yourself, it's just a bit of friendly advice (probably given in vain).

Cookie cut complex? I don't think so. The equation for that operation is:

$$D = \overline{A}B + AC$$

Where A is the object mask, B is the object bitmap, and C is the background
bitmap. D is, of course the destination.

With the Amiga blitter, you can get substantially more complex operations
than that. Some which any microprocessor would have serious problems competing
with the blitter speed-wise.

In fact, the Amiga blitter is more complex than the Jaguar blitter in
several respects. Don't ask for any specifics though (can you spell NDA? ;-)

Griff, the blitter is faster than the 68040 on most operations (on an
Amiga). Also, by leaving out the blitter from the system, you lose one
nice feature: the blitter can do its thing concurrently with whatever the
CPU feels like doing. I don't know if the Atari blitter does this though.

Commodore Denmark handles all nordic countries now. In reality, however,
the role of Commodore Sweden has been taken over by K&K, who support the
high-end machines and handle the developer support. That's all CBMSWE was
good for before, anyway. No big deal.

Here's a clue: Ever heard of an optimization technique called
interleaving? Also, have you ever checked the relation between the
execution times for the SWAP and DBF instructions?

The above does not indicate that the Falcon has a 32-bit bus.

nice theory Chris, perhaps you should practice what u preach.

this is a sideline, back to the original question : do you still think
an AGA blitter can 'outblit' an arm3 or 68040?
(HINT: the answer is NO, I have a lot of people behind me on this one, so
be careful what u say).

|> Griff

Hmmm.... I'll like to see that. BTW, is NVDI something that COMES
with the system or not? Because if it's an add-on, there are others
for other computers...

|> :-)

But... hmmm.... shouldn't the 3d calcs. do that implicitly for you?
Or are you simulating - I mean - faking the 3d positions like the tmapping.
I had an idea on my old 8-bit and for a lot of space games that faking
3d positions can be made far faster and still quite convincing... but I wonder
about a 3d-doom like game. Could you please specify a bit further?

|>
|>
|> Oki ... speed .... 320*240*65536, on a 16Mhz 030, using move.l (no bl**dy 16bit
|> bus here!) on a VGA monitor...(will be twice as fast on RGB/TV) ...

[start advocacy mode]

Ah, we just had to throw in an advocacy argument here, right? Okay,
it will be FASTER if the Falcon had a true 32-bit bus. WHY you continue
denying THIS FACT POSTED FROM INFORMATION FROM *ATARI* LAST YEAR 1993,
RICKARD? And you say it will move twice as fast on an RGB/TV? Sounds
like the Falcon shares huge bus contention problems too.

[end of advocacy mode :-|]

|>
|> 15fps

:>>And the FACT remains that the blitter is a lot slower than a FAST CPU,
:>>an nice easy analogy for you, the Atari Falcon has a blitter to support
:>>its 16mhz 68030, the 32mhz 68030 Atari TT DOES NOT, because using the
:>>processor is faster, an 040 seriously kicks a 1985 blitter stone dead.
:>>(and don't hark on about the AGA blitter its 40% faster than the ECS
:>>blitter MAX, and no faster at line drawing etc).
:>
:> Griff, the blitter is faster than the 68040 on most operations (on an
:>Amiga). Also, by leaving out the blitter from the system, you lose one
:>nice feature: the blitter can do its thing concurrently with whatever the
:>CPU feels like doing. I don't know if the Atari blitter does this though.

Well I have to disagree, an 040 should be *much* faster, unless of course contention is a big problem. An 040 should be able to move about 30meg/s (even my 486sx-25 manages 33meg/s). Also the blitter is so sslooooowww at getting started, an 040 could do a lot of processing in the time it takes to setup the regs and get going.(if contention is a problem, then wonderful fastram comes to the rescue, you draw the screen in fastram and copy to the chipram screen).

Are you saying that a blitter could fill more polys/draw more lines/ do tmapping/shading/resizing/rotating faster than an 040? These are pretty basic 'bit' graphics operations and the 040 wins every time.

1438. IS there a Jag FAQ

Newsgroup: comp.sys.atari.advocacy
Date: 1994-03-15 02:28:59 UTC
From: JP4232@CONRAD.APPSTATE.EDU
Message-ID: <2m36hb$392@lester.appstate.edu>
Source record: 17939

First of all I have looked through what my news server has for this file.

If Jag could be given a keyboard into the second joystick port and a
network through the cartidge slot then it could be a low cost VR computer
for schools or even a cheap color X terminal or other type of color terminal.

Hell, it would be a lot cheaper than a Mac or PC and since it is
Diskless (Floppy or Hard) students couldn't steal software or
upload stolen software. It would deliver performance close to Pentium and
could exceed it.

I have seen the Falcon, but I would also be interested in seeing the
Jag's internal structure to see if it could be built up to a general
purpose machine with CD ROM , pcmcia type ?? slot for under
$1000 - $1200 dollars. It could then use jags as terminals

Imagine:
A Jag base with 8mb RAM expandable to 128+mb
Doublespeed CD Rom
The Computer Based OS on Cartidge (at least the kernel)
When that cartridge isn't in it's just a jag
that runs better.
4 PCMCIA type (best) slots
For Large capacity Hard drives or SCSI II card
Peer to Peer Networking/ Telecommunications
AV work input port

If you know why this can't be done, don't flame me. Just tell me.
I am only trying to be productive.

I know what you mean - at a place I used to work for, the workers
would copy everything off of the machines even remotley useful - so
they could trade copies with other people!

Occasioanlly, they would even use the company copier to whip out
copies of the 300+ page manuals. I would have stopped them, but
anything to harm the PC market is OK by me... :-)

: I wonder what chips they are referring to?!? The evr so popular 6845?
: The 8088? Or even the 74 series? Oh, wait, it must be the 8245s!

: Bernie

It's common knowledge that Lew was head of the design team that produced
the PC itself, not the chips. I thought you PC owners should know that.
And that he know thinks they aren't a patch on Amigas, too much cost
cutting at IBM...

Stay in the stoneage

Just decided to make a little post. I got my PowerMac today and I'm
willing to bet that it gets better screen redraws then your falcon :)
With that I get about 10 times more speed. You may want to play with a
PowerMac, they are kinda cool. I know that you love atari so you can
preview the chip that will probably be using by the end of the year
in what? The POWER Falcon/601.

WE> periodicals and I have yet to see ONE ad for the Jag. At least I
WE> saw a lynx ad a few

There's a two-page spread running around in a few gaming magazines (which features a giant jaguar about to pounce on Mario and Sonic). After looking at the ad for about a minute, I immediately decided that Atari needs to fire their ad agency/PR department. Of course, I decided that back when they had that Lynx ad on television of the kid playing the Lynx in the school bathroom, also. <g>

|> and post misinformation about other platforms..
I for one have never claimed the Falcon is the best computer ever. it isn't. What it is however is the machine I feel most comfortable with. I like the software for it, it does what I want in a way that I like. It's 'fun' that difficult to quantify thing that some systems have.

I don't get fun or enjoyment from PCs or Macs - they just feel dull & boring to me when I use them. The only other system that I like using outside ST/falcons is Unix and I can't afford a decent Unix system although I may buy a PC and install BSD386 or Linux..

You'd better watch out now.. Questioning Griff's posts, we'll soon have
threads entitled 'Mr Jackson's fantasy' and such. :-) :-)

(And yes Griff, I do know it's a word level blitter. It does, however, do a
rather good job of bit blitting thanks to its internal barrel shifter.)

>the ECS blitter to write more than 40K in 1/50th of a second. There
>simply are not enough DMA cycles available. I don't know where you're
>getting your figures from, but they are simply incorrect.

so clearing a 320x200 screen takes nearly a whole 1/50th of a second?
even an st can clear a screen in 1/100th of a second!

read ya h/ware ref manual (pg 188) (you DO LOVE TEXT BOOKS)

t= (n* H * W / 7,090,000)

H in this case is 80 words, H is 256 (lines) and n is 4 (ticks)

~ 1/100th of a second.

I guess I must be talking crap! (laugh) Just admit your wrong.

Griff

Well, that must be Sweden ;-)

|>
|> I even talked to a schoolmate who looked at me and said: "Buy programs?
|> Whatfor?"

So it means that either:

1. You have a distorted perception

2. Most people pirate (or let's say, everybody you know) the program...

So Rickard, congratulations if #2 is true.... you must be the only one
then who doesn't pirate them I suppose :-)

Well, Griff. I'm sorry, but you're all wrong on this one. A blitter copy
takes only three cycles longer to execute compared to a blitter clear. Read
the Amiga hardware reference guide if you doubt it.

How? "Because you run a BBS?" Do you keep track of the serial numbers?
If you have ATARI information, post it.

|>
|> Actually I convinced a friend of mine that developing hardware/software for the
|> Falcon can make bigger bucks than on the PC/Amiga ... less competition and
|> users willing to shell out money ....

Hey, I even know one that still thinks you can make money developing
for the Apple II. But then, AH! You 'convinced' him to develop....
Ha!

About the "users willing to shell out money" part that's simply hilarious.
Do you think that if piracy in the PC around you is so rampant, that it won't
be for any other computer?

Pirates don't consider much the money differences... all it matters is
that either "I can get it for free" or "I don't."

1458. REPOST: Atari top ten..

Newsgroup: comp.sys.atari.advocacy
Date: 1994-03-16 05:10:23 UTC
From: sinclap2954@cobra.uni.edu
Message-ID: <1994Mar15.231023.24492@cobra.uni.edu>
Source record: 17959

```
== TOP TEN REASONS TO STILL CHOOSE AN ATARI OVER A MAC ==

10) Just one model in production (Falcon) makes selection a 'no-
brainer.'
9) Tramiel's multimedia computer development in a 'class by itself.'
8) Still sports the largest collection of 'masochistic' programmers.
7) Less time wasted reading thick, glossy monthly periodicals.
6) No portability 'problems' due to no portable notebooks or laptops.
5) Extensive collection of 'two' games available for the amazing
Falcon.
4) Limit of one dealer per metropolitan area promotes close friend-
ships.
3) One-piece design featuring 'mushy' keyboard way ahead of it's
time.
2) Ergonomically-placed joystick ports good practice for fumbling &
cursing.
1) Who really needs all those CD-ROMs anyway?

TOP 10 REASOMS TO BUY A MAC
---------------------------
10 - words like CDEV, INIT and FPU are lots easier to learn than
DOS, DEL, and INTEL
9 - the local computer store has fewer shelves of Mac computers
making buying decisions easier
8 - you haven't lived until you see an Application not Found error
7 - where else can you buy a Centris and end up with a Quadra?
6 - Jack and his sons don't do Mac
5 - Windoze 4.0 will break more programs than System 7.0
4 - Macs aren't just user friendly, with added sounds, wallpapers,
and startup screens, they are down right cuddly.
3 - Microsoft does its experimenting on that other computer, leaving
us safe a while longer
2 - Sim City 2000 is awesome!
1 - Swampy don't hug IBMers

Sigh, here we go again.......

|> == TOP TEN REASONS TO STILL CHOOSE AN ATARI OVER A MAC ==
|>
|> 10) Just one model in production (Falcon) makes selection a 'no-
|> brainer.'
And the TT. I like the facts that as you stated, the Mac has several designations
for the same model. Nice & clear.

|> 9) Tramiel's multimedia computer development in a 'class by itself.'
Yup :-) At least it has classy owners.

|> 8) Still sports the largest collection of 'masochistic' programmers.
Why masochistic? Skilled and intelligent certainly.

|> 7) Less time wasted reading thick, glossy monthly periodicals.
I read ST User, ST Review, Computer Shopper, ST Format, St Applications. Keeps me
going.

|> 6) No portability 'problems' due to no portable notebooks or laptops.
There have been portable ST systems and there have never been any problems with
these machines. The programs didn't need to be modified to run on them. Maybe
this is a problem with Macs? As I said before, before portable Macs were
available, people bought portable STs with Mac emulators to get a portable Mac...

|> 5) Extensive collection of 'two' games available for the amazing
|> Falcon.
4 actually. More on the way plus all the ST programs (many...)

|> 4) Limit of one dealer per metropolitan area promotes close friend-
|> ships.
Near you maybe. I have many places to buy ST sofwtare - more than Macs in fact.

|> 3) One-piece design featuring 'mushy' keyboard way ahead of it's
|> time.
I like the Falcon keyboard. I've used PC, DEC, Amiga, AS400, Mac, Atari, HP and a

|> 2) Ergonomically-placed joystick ports good practice for fumbling &
|> cursing.
It's a fair cop, these are crap.

|> 1) Who really needs all those CD-ROMs anyway?
I do and so do many other Falcon/TT/ST users I know who have CDROMs connected to
their machines. Atari sold CDROM drives for the ST in Germany back in 88 or so
when there weren't even CDROM about! We were there first! There are now dedicated

ST CDROMS (not many) plus you can use fonts, graphics, data etc. from PC/Mac ones.

|> TOP 10 REASOMS TO BUY A MAC
|> --------------------------
|> 10 - words like CDEV, INIT and FPU are lots easier to learn than
|> DOS, DEL, and INTEL
If you say so.

|> 9 - the local computer store has fewer shelves of Mac computers
|> making buying decisions easier
Thank God.

|> 8 - you haven't lived until you see an Application not Found error
You haven't lived.

|> 7 - where else can you buy a Centris and end up with a Quadra?
In your dreams.

|> 6 - Jack and his sons don't do Mac
Ah, one up for the Mac camp!

|> 5 - Windoze 4.0 will break more programs than System 7.0
How can you make a statement like that? a) you admist system 7 breaks programs.
Nice one Appple. b) You can't say an unreleased product will do X. It's a
non-statement.

|> 4 - Macs aren't just user friendly, with added sounds, wallpapers,
|> and startup screens, they are down right cuddly.
PC, STs, Unix workstations can all do this. Probably HP calculators too.

|> 3 - Microsoft does its experimenting on that other computer, leaving
|> us safe a while longer
Another plus for Macs. That's 2 so far...

|> 2 - Sim City 2000 is awesome!
Sim City is dull.

|> 1 - Swampy don't hug IBMers
Wibble.

|> Peter Sinclair-Day
|> University of Northern Iowa
|> Cedar Falls, Iowa USA

PETER!!! HOW ABOUT ANSWERING SOME OF THE POINTS I HAVE MADE ABOUT HOW YOU ARE
WRONG ABOUT ATARIS? CAN YOU ADMIST YOU ARE WRONG?

:>>time as a copy op (using channels a and d).
:>>THIS IS COMPLETELY WRONG, a memory copy will take twice as long. A blit
:>>using all four channels will take twice as long again. Could some other Amiga
:>>coder post and tell Mr Brown that he doesn't know what he is talking about.
:>
:> Well, Griff. I'm sorry, but you're all wrong on this one. A blitter copy
:>takes only three cycles longer to execute compared to a blitter clear. Read
:>the Amiga hardware reference guide if you doubt it.

according to the h/ware ref manual, it takes 4 ticks per op, (the same as
a fill), but when you actually do this in real life, the timing bar jumps
a considerable amount (1.6-2.2 times as much time depending on the res),
I'm only speaking from MY experience, a while back I had some 3d vectors
going and I thought a background picture would be nice instead of clearing
the screen, but it took too much time (longer) so I ditched it.

>Stefan Boberg, Amiga/SEGA/CD32 programmer - Team 17 Software / LhA Devel.

|> >getting your figures from, but they are simply incorrect.

Wouldn't go quoting out of context bits of email, Griff. It confuses the reader and, quite frankly, it's rude. That's why I never quoted that little snippet you sent me about a certain piece of software and the activities of some very naughty boys whom the Federation Against Software Theft might be quite interested in having a chat with.

|>
|> so clearing a 320x200 screen takes nearly a whole 1/50th of a second?
|> even an st can clear a screen in 1/100th of a second!

Depends on your colour depth really, doesn't it? As I originally said, using the blitter to clear a piece of memory isn't a terribly efficient use of it. I won't explain about it's DMA cycles again, because I've already done it several times. You didn't take a blind bit of notice then, so I don't see why you should now.

|>
|> read ya h/ware ref manual (pg 188) (you DO LOVE TEXT BOOKS)
|>
|> t= (n* H * W / 7,090,000)
|>
|> H in this case is 80 words, H is 256 (lines) and n is 4 (ticks)

Ah, so he finally realises that the blitter DOES only write on every 4th DMA cycle (every 2nd even DMA cycle.)

|>
|> ~ 1/100th of a second.

That's nice. Slight problem there is that your blitter magically seems to have grown an extra set of DMA cycles. Try dividing by 3.5 million instead of 7.1 million. (Unless you're talking about the AGA blitter, which I doubt, because the AGA hardware documentation isn't publicly available. Then again, neither was the above mentioned software package.. :-))

|>
|> I guess I must be talking crap! (laugh) Just admit your wrong.

Well, Griff, the slight problem with admitting that I'm wrong is that I'm not. Are you just doing this to try and get attention? It certainly seems that way. Perhaps it would be more beneficial for you if I just ignored your postings...

TOP 10 REASOMS TO BUY A MAC

Still misspelling "reasons", eh? Even I, world champion mispeller,
would not be so foolish...

Here's the corrected version of the real Top Ten list he meant to post!

10) "Mac" Rhymes with "Frac" - cool Battlestar Galactica swear word
9) Point n' Drool interface reqires less thinking than watching "Baywatch!"
8) Mouse is great if you loose nine fingers and nose in freak accident
7) Your purchase funds the mightest team of lawyers this side of LA Law
6) Get to own dying platform - have great contribution for museum of future!
5) Be the only person on your block with a non-preemtive OS!
4) Can use that mac keyboard cable as S-Video cable - who needs a keyboard!
3) Pretty Screen Saver Make User Happy
2) Get rid of pesky loose money by buying expensive Mac apps

And the number one reason to buy a mac is...

1) Free Peter Sinclair-Day scratch n' sniff sticker free with every purchase!

P.S. - I've saved the thing this time, so I'll post mine every time you
post yours! What fun!

Likewise, I had a C64 and bought an Amiga, everyone I know who upgraded from a C64 (and quite a few other 8 bits too) bought an Amiga. The ST was never an option because it just didn't deliver the goods (both in terms of hardware and software).

He's just spouting them. I was at the launch of Digita's Wordworth 3 WP in London last week. They were selling one every few seconds. Most people there appeared to be A1200 owners (I saw someone buying one of those 68030/memory expansion combo cards too.)

>>>Does C= and Atari have a future in the computer market?
>>
>>>Atari is dead as far as their computer division is. But Atari droids cannot
>>>see the light.
>>
>> It makes you wonder about the falcon doesn't it.

Apologies for digging up this thread, but I thought I'd say something.
I saw the specs for the Atari Jaguar today. If the graphics capability had
been the specs for a unix workstation 2 or 3 years ago, they would have been
very impressive (excluding SGI's). This machine will sell for $hundreds,
whereas a general purpose computer with the same graphics will sell for
$thousands. Then again, the computer has to provide hardware that the
Jaguar doesn't need to (floppy drives, hard disks, full keyboard, etc).

I'm suprised the Falcon didn't make a much stonger impact than it
actually did. It didn't do very well in Australia at all. *If* Atari can
keep their computer division alive, they have the hardware in the Jaguar
to develop a seriously impressive general purpose computer (Falcon-2?).
They obviously now have experience in working with risc technology, but
will they be able to develop an O/S that's up to the same standards?

Personally, with the class of game systems just emerging from
Atari, Sony, Nintendo and Sega this year, I think this is the doorstep
of an unsuspected revolution in computer technology. In the past it was
the technical/business end of the market that drove computer technology
development. Now we are looking at a level of development that even 12
months ago was considered remarkable. And for what? TV game consoles.
This is technology which will filter back into mainstream computing,
rather than mainstream computing technology driving the game console
market.

Once the eye health issues currently facing head mounted displays
are adequately addressed, we may just see William Gibson's "cyberspace"
become economically viable.

>>>Lets face it C= and Atari will never do well in the North American market and
>>>various parts of the world such as Australia.
>>
>> Amiga's do OK is Australia, esp the CD32.

They don't do as well as they used to. The Amiga's share of the
personal computer market in Australia has shrunk. It's going to take
something special to recapture the lost ground. It's going to take something
really special to put Atari back in the picture here in Australia. The
Jaguar may help with that, but Atari is going to need a more impressive
system than the Falcon to take advantage of any marketplace momentum the
Jaguar may give them.

>>>Once the Power PC macs come out on the market world wide on March 14 or sooner,
>>>the price/performance ratio will widen. A $2000 Power PC system($1700- my
>>>price) will be competing against a $1500 Amiga 4000/030 with out monitor and $1500
>>>Falcon HD system with monitor(I am being generous with price)

Both C= and Atari are facing uphill battles in keeping abreast of
advances in the PC and Mac arenas. They have a fraction of the budgets
that their bigger competitors are able to allocate for R&D, and a
fraction of the purchasing power when sourcing components for their
mass production. Any short term future lies in niche markets for both
C= and Atari. Longer term viability will depend on technology
convergence among the larger players (eg Apple/IBM alliance with the
Power-PC chip).

The next 2 years are going to be very interesting. :)

The only thing you show with a message like this, is that you know nothing
about Atari, and you also know nothing about Mac's.

Who are you trying to fool!

Maybe you should try work with an C64 insted. It seems to be the only machine
you can handle.

Ricardo Hernandez drove Bus #<1994Mar16.190353.41330@rmece02.upr.clu.edu>
onto the Information Highway:

: I have seen it... and it couldn't run DOOM * BECAUSE* IT is a 286
: emulation!

: Now, I'll admit, there must be (or will be) a 386 emulation sometime...

Insignia is promising 486 emulation by the end of the year. Frankly, I
can wait. I played around a bit with SoftWindows and I was pleasantly
surprised -- it "feels" (scrolling, window updates, etc.) like a fast 386
with a decent graphics card, even on the 6100 (low end box) -- not bad for
what amounts to a "free" computer thrown in the box with your PowerMac.
(well, the SoftWindows bundle version does cost a bit more, but not by
much).

I have one, but it's broken. I think the problem is in the connections between the keyboard part and the display part. I get a screwed up display most of the time when I turn it on. I bought one and it failed after about a year of pretty heavy use. I sent it back to Atari and got another for a couple hundred bucks. When the second one broke after another year, I just stopped using it. I didn't want to spend another couple hundred dollars every year or so...

Does anyone know how to open it up? One of these days maybe I'll do that and fix the cable. . . .

Get out your dictionary, Peter.
Look up "Advocacy".
If this task is not beyond your pitiful mental capabilities you will
find that it means "The act or process of advocating." or something like
that, depending on who'se dictionary you use.
Now comes the hard part.
Look up "Advocating". It will be listed with "Advocate". Be careful
here. There are two forms of "Advocate". One is a noun, the other is
a verb. This is the one you want. It will say something like, "To
speak or write in support of".
^^ ^^^^^^^ ^^

Now look at what group you keep posting to:
comp.sys.atari.advocacy
^^^^^

If you want do dispute something that someone says in their advocacy
of Atari, feel free. But if you want to advocate PowerPC or Mac or
System 7 or anything else, post it elsewhere. Believe it or not,
some of are interested in other systems than Ataris, and we look
```

for information about other systems on other news groups. There is no point in flooding this group with the same stupid stuff over and over.

I am certain you will respond to this with more drivel, but I am finished. You have ***NOTHING*** to contribute, Peter. This will be my last posting in response to you. I hope everyone else will also refrain from responding to you. Then maybe you will eventually give up and go elsewhere to spread your stupidity.

Kendall, have you heard about hype? Selling magazines? Best game
of the month is ok. BEST GAME OF XXXX (year? Decade?) like
the original 'awards' mentioned seem a bit ludicrous to me.

Isn't it funny, that EGM who has slagged off ATARI constantly now
is being considered as an objective source?

|> In short, those who claim it is just Temtest are really mistaken.

Well... it *is* Tempest... an enchanced version of it.

I am waiting for AvsP... :-)

Have you tried "Ridge Racer" at your local arcade? It's a lot like
Atari Games' "Hard Drivin'" - in concept that is. I hated "Hard Drivin'"-
it reacted to slow, the graphics were blocky, etc... Compare that to
"Ridge Racer" - very quick, fun to play, greate graphics, TOO fast at
times. I wouldn't stick a quarter in "Hard Drivin'", but "Ridge Racer"
is a dollar a pop - and the machine does not sit alone for long.

Anyway, what I'm trying to say is that if you expand the concept
in an intelligent way (we're not talkin' Super Mario World 18), you
could have a cool game. Just look how many sports games there are
out there - why bother producing them at all? Didn't Atari do it
already on the 2600?

Anyway,
Michael

>the bus time should be in contention.

>Read some more books on DMA access Gavan, and start stating instead of guessing >okay.

Well, although DMA generally will do its fectches whilst the CPU is executing instructions, there will be times when DMA and CPU clash. This is why an A1200 with only chipRAM is only about half the speed of one with fastRAM. Its also why all Falcons slow down as you up the resolution - the screen DMA is `stealing` cycles from the CPU.

ALL DMA takes up system bandwidth, its just that a lot of the time this doesnt matter as the system is operating within capacity. Its when you have a lot of things going on like there is in the `dual playfield` type effect that you are going to notice DMA contention becoming a problem.

Its just not true toi suggest that DMA wont have any impact on overall processor performance, though its still better than getting the processor to do the xfers itself.

Gavan.

Yes, RT *DEFINITELY* claimed that there was no such thing as a 1Mb
Falcon, as did other people too. I actually saved the text but lost it
when I lost my old account. Its amazing some of the claims and `facts`
that certain Atari owners will post when they feel that someone has
sleighted their machine.

I can remember people claiming that the Falcon had dual ported RAM as
standard and claims that the 256 colour mode was chunky......

(In
>Sweden, I don't know what happened where you live though)

It seems to have been the other way around in the UK (and the rest of the world outside Sweden). C-64 owners stayed loyal to C= and most of the Atari 8-bit people went and got STs. In the early days when the ST was popular it did of course get the upgrade market from all kinds of 8-bits though.

>The Amiga's design is much closer to the Atari 8bit.

Yes, very very similar indeed. In many ways the 8-bit Atari XL is in fact an 8-bit 6502 based Amiga. Thats why I bought an Amiga and not an ST. I still have my old 800XL.

>GM> Maybe I`m just too optimistic but it seems that piracy is on the
wane
>GM> on the Amiga - attitudes are changing. Plus CD32 means that more Amiga
>GM> stuff is coming out on CDROM which will help cut piracy.

>WHAT? .. Geez ... You like to talk about the big Amiga market .. yeah
sure, of
>those 260000 A1200's you can bet that only 1 out of 100 buys his software
....

>(Out of the "35000" Falcons I can promise you that figure is much higher)

Amiga software sells as well as Sega cartridge games in the UK. CD32 software not outsells ALL OTHER CD FORMATS in the UK - and that includes MegaCD and PC-CDROM software. People do pirate, but there are enough honest Amiga owners to make a market.

>Actually I convinced a friend of mine that developing hardware/software
for the
>Falcon can make bigger bucks than on the PC/Amiga ... less competition and
>users willing to shell out money ....

What are you people smoking in your part of the world?

Gavan

Demo writers do make good games programmers, but unfortunately they do
tend to write system unfriendly code. Crashing when fastRAM is installed
really is ridiculous. Still, I hadnt played the game for ages so it is
possible that the disks had become corrupted since the time I bought the
expansion. It could be that the expansion is dodgy too - quite likely
since I got it cheap and other things like the internal clock are dodgy.

>PS. Does anybody have a technique for the '36/100' on level 2 of stardust?
> (time seems to be a real bitch on this level).

Thats just lots of meteors with a tight (60 sec) time level? I made
sure I was really powered up (full bouncers/plasma and two missiles) and
just went in there with bouncers. Good shields help here as you can use
them to destroy the rocks too.

Actuall, this is probably a good sign for the Jaguar. A company who has no real motivation to hype any Atari product has finally picked one of it's games as game of the month. I would be more willing to accept their judgement because of the "no love loss" between them and atari. Also, Die Hard Game Fan picked T2K as game of the month. Two different mags picking the same game has to say something, even if there is some market hype involved.

Hello,
this morning i read in my CT (4/94) that "Atari-Deutschland" (Atari
in Germany) isn't existing any longer?
Is that really true?
If it is, Atari is really at the end - Germay was one of the
greatest markets for Atari-Corp.
Thanks, Friedemann

|> Gavan.
|>

It is very convienient that you lost that text. I don't doubt that that
those who were trying to prove a point would interpret what Rickard said
as meaning no such thing as a 1MB Falcon. We all know that Rickard often
gets over enthusiastic and often posts incomplete bits and sometimes even
with less than the best grammer. As I knew that there were plans for 1MB
Falcons all along, it was easy for me to realize what Rickard was trying
to say (that he had never seen one for sale and that developers were told
that the 4/65(80) was the base). You, however, were trying to pick a fight
and of course interpreted his remarks as meaning that a 1MB Falcon did not
and would not exist anywhere. Sure you may say that I am just defending
the point because I am biased towards the Falcon, but I think we all tend
to take what we want out of post and bend it to say what we want it to say.

Hey, this is a free form advocacy group so stop taking everything someone
says as some kind of gospel and stop reading more into someones post than
what is there.

Don't get me wrong. I'm not saying the Amiga blitter is more powerful overall, just that it has some features not found in the Jaguar blitter. Obviously, the Jaguar blitter has a number of nice features not found on the Amiga one.

What the heck are you talking about??? I have several programs that
allow the user to move windows around and I didn't think it was
difficult to program at all. I programmed on a Mac some years ago
and I found that to be a pain (like trying to use the Toolbox without
causing the system to crash 'cause you didn't pass the parameters
just the right way).

after reading this newsgroup for some time, i've seen a lot
of rude and inconsiderate posts, but none puzzle me as does this "sinclap"
fellow. i can imagine a mac user finding this newsgroup and posting maybe
one message like "atari sucks, get a real computer" and then getting on
with his/her life, but mr. sinclap seems to get some sort of power trip
by coming on here ALL OF THE TIME and posting his stupid messages about
how everything but the Mac sucks!

What's even more pathetic, HE DOES THE SAME THING ON THE AMIGA
ADVOCACY SECTION! Do you have a life?! If you enjoy your computer,
fine! Who has so much time to waste that they actually take the time
out to make a "Top Ten Reasons Not to Buy Atari?!"If this sort of
behavior s normal at the university of northern iowa..!

Are these portables in production? These Atari portables are not availabe in North America. Comming April 25: You guess it another round of Mac Intros, this time a new series of powerBooks code name 'Blackbird'. Gee how many new Macs has Apple introed since the Falconcame out. Apple had 200,000 PowerMacs available on opening day. Thats what you call real marketing coordination. None of this six month- a year later shipping after the official announcement.

:#I don't think that is what people were saying. I believe it was something
:#along the lines of "They're just going to be Amiga 500/1200/etc.. games
:#with extra levels and music.", not "They're going to be re-makes of yet-
:#to-be-seen-on-the-Amiga games.". I mean, 90%+ of all games out there
:#are just remakes of old games anyway. Hard Drivin' was one of the first
:#arcade games to really put you "inside" a car, but just check out Ridge
:#Racer or Virtua Racing or ... Improvements on games are possible, and
:#they make the game a lot more funt to play. No one is claiming that the
:#Jag games are all "new and original in concept".
:#That would leave about two games for the system.

No. It was I that said that many of the CD32 early stuff would be ports
that were from the Amiga software but, with added extras. The people that
were responding to me said that the CD32 software wouldn't have much extra
and would be just direct ports that would only take about 2-10 megs on the
CD. Though not everyone took this extreme a view but to a varying degree
with some. There was someone claiming that Jag games would be all "NEW",
remember Rickard? He originally claimed this and I even showed him his
post when he asked for proof of it. I've yet to see him prove anything
that I've asked for.

I don't doubt that T2000 is a good game but I wanted to show how
hypocritical some people can be. Bias is one thing but to let it color
your thinking just because it's the competition? Oh, and I should mention
that so far all the games that came out for the CD32 are games that I don't
even have in my software collection, for a lot of other people this must be
true to one degree or another, so there are lots of good games that I and
others haven't played as yet available for the CD32. Of course, I don't
have any of the games on my computer that is available for the Falconn
either. But I have about 1 or 2 computer games that already came out for
the 3D0...8-).
3D0..8-).

>is being considered as an objective source?

Hey, you didn't her ME claiming that EGM was an objective source.
What I take into account when analysing their like of Tempest is:

1) Other people and magazines have reported equal enthusiasm for the game.

2) Egm has been far from pro-Atari in the very recent past.

3) The author is Jeff Minter, which says a lot for the gameplay.

So, I conclude that this game must actually be pretty good. Believe me, if only EGM were trumeting the wonders of T2K, I'd be the last to play along...

>
>|> In short, those who claim it is just Temtest are really mistaken.

Piracy had nothing to do with it!!! I know a lot of Amiga owners who pirated software on their systems here in the USA. Piracy didn't kill the Atari system. It was Atari themselves that killed their own system. Sure software companies were pointing the finger at Atari owners for pirating software but every computer system has them. The only reason these software companies were pointing the finger at the Atari community was that the sales of software didn't amount to any decent profit so of course they are going to pick on the little guy. As for the so called clones the market is flooded with them and it doesn't really stand out as much as the little guy. Its like an elephant standing next to a mouse, you can easily see the difference.

How come I can go into almost any store in the USA, and see, or even purchase a Jaguar but I haven't seen the A1200 or the CD 32 except in mail order catalog. Answer me that bright boy!!!! Also, ask anyone thats not around computers or don't know too much about computers, to see if they know what the A1200 or the CD32 is. But if you ask them if they have heard of the Jaguar most likely they will.

Yes I'm an avid Atari user and I love my machine. I am really pissed-off when you say that it was the Atari owners pirating the software that killed the Atari computer. What proof do you have to back this obscene statement?!? Your probably one of those people who talk out of their ass!!! So until you can back up what you say then you are totally wrong and inane!!!

Well, C.P. is such a brainless dork that he's probably been killfiled by
everyone who takes the comp.sys.amiga* groups so he's had to come over here
to find someone still willing to listen to him. I doubt that will be the
case for much longer...

BTW, C.P., *plonk*.

: statement?!? Your probably one of those people who talk out of their ass!!!
: So until you can back up what you say then you are totally wrong and inane!!!

Probably because the Atari ST has about 600,000 units sold in the UK.
The Amiga has about 4 times more units sold in the UK (from A500, A1200,
A4000, etc). The software sales for Amiga software amounted to 25%-30%
(or there abouts) of the market, while ST software sales was about 1 or 2%.

There are pirates on nearly everyone platform, from illegal copies of
AT&T Sys V, R4 and compiler, to dodgey games on a C=64. But piracy
hurts the platforms with the smaller user base than more popular
platforms. Small user bases usually means you have to target the high-
price, low-volume software market.

There are 1/4 as many ST users as Amiga users, but the software sales is
10x more for the Amiga. I'd say piracy has a lot to do with low software
sales. For the C=64 and other old 8bit machines, piracy is about the only
way you're going to get any software.

JC> that I've asked for.

Ok, one more time. (do you have learning problems?)

On the CD32, developers can take an old game, copy it to the CD and release it
as "new 32 bit blasting software!!!" (And they have done it too)

...that is impossible on the Jaguar. You *HAVE* to WRITE the game code, thus
there is a bigger chance of new featurs being added.

I can repeat this as long as I need 'til you understand.

Excuse me, piracy is rampant on all platforms. Atari Corp killed the Atari
computer. atari did not advance the hardware and competed on the cheap.

Of course, the _real_ way to argue with this point is to say that the shorter
amount of time it takes to get a working version on the CD32 allows for more
time to add enhancements, thus increasing the chance of more features over
an equivalent Jag game. But I know software devleopers, "if it works - Ship
It!" :) Only add features if you HAVE to take apart that code anyways. :)

Atari sales? In Sweden? Considering it's painfully close to nil, it's
rather difficult for it to decline, isn't it?

Seriously, the only market I can see is for musicians that can't afford
a Mac. Computer hobbyists either buy PC's or Amiga's, depending on age.
Not only is it difficult to find a dealer that sells Atari machines, but
finding software for it is even more difficult. Browsing through a couple
of generic swedish computer mags, the only place I could find selling Atari
software didn't advertise any titles, but had a little note in a red box
in the right corner saying "Games for MSX, Atari ST/STFM/STE/130/800/2600,
Vic-20, ZX Spectrum and TI-99/4A are available. Free price list available.
Name computer."... The other computer models mentioned in the note say
quite a lot, don't they? [Obsolescence is what they tell me ;-)]

Well, maybe it's time to try the so called 'mailbombing'. If sinclap don't
know what that is, he sure gona have himself a supprise, and i'm sure his
Host is gona react upon that as well. I have never seen this mailbombing, but
just heard, that it can be very usefull, if you want to remove some guy.

If he is sitting at somekind of school, this mailbombing can cause serious
damange to their system, and/or maybe close the connecting in one term.

What do you say mr. sinclap. Are you prepared to take this ?

I tried mail him a personal letter with friendly feelings. Didn't help.

I have a few powerfull friends here, who are prepared to give him this mailbomb.
I'm sure they can supply a few hundreds Gigabytes of crap in just a few seconds.

Let's see if he can manage that.

One difference between CD-32 games and Jaguar games as far as ports
go, I think, is that the CD-32 are straight from the Amiga line
while Jaguar's games (ported or not) have to be written for scratch.
Maybe this was the argument? I don't believe that anyone believed
that the Jag would have no arcade ports. After all, from day one
Jag owner have been speculating on NBA Jam and Mortal Kombat.

So? That really doesn't say anything much, considering that the number of
PC clones that were sold probably outwieghs both the Power Macs and the
Falcon sales combined. And the majority of them sold were probably
inferior to either (386's). Anyway as if the Falcon was competing with the
Power Macs anyway. I for one am not going to lose any sleep about it.

200,000 PowerMacs sold less than a week after its rollout. I guess you are right that the Falcon is not competition,at those sales figures.

Thats being honest. No flame intended, but Atari is not a vaiable platform.
When is atari going to upgrade their Falcon? When is Atari going to support
their developers and users. Yo canot honestly reccomend any atari computer to
general users. I suggest you pick up a PC and Mac magazine and see whats
available and then you should ask your self "With all these choices, why Atari?

Apple had over 100,000 on dealers shelves on day 1 and tens of thousands more shipping all week. Unlike Atari and C= who announce things but takes six months or more to get on the market.

I never said that the Falcon sucked. The Falcon and to a certain extent the Amiga are unsupported machines. In Atari's case the falcon is a dismal failure due to its lack of market acceptance. I am sorry but its shameful to advocate a computer that has no future, lack of software and support and knowing that future models are not on the horizon. Hell PC's and Macs are cheap with lots of plentiful and cheap software and hardware. There is no convincing argument left in advocating a falcon with so many choices out there. No flame intended with this one, but a Power Mac 6100/60 8/160 sells for U.S. $1599($1457 my price) while a decent configured Falcon sells for $1299.

> There's no software that'll work on a 1/0 config, the whole thread is silly.

You just made it sillier. Any clean-living GEM or TOS program that ran on a 1040 STe will run on a 1/0 Falcon. I'd be willing to bet that this includes Dr.T's KCS in its basic configuration, and tons of other useful stuff. 'Tis true that when Falcons were hard to come by the 1/0 config. was downright impossible: IMO Atari only announced it so as to have a low (<$1000) ``base'' price.

Walter Koziol <wkoziol@delphi.com> writes....

> Piracy had nothing to do with it!!! I know a lot of Amiga owners who
>pirated software on their systems here in the USA. Piracy didn't kill the
>Atari system. It was Atari themselves that killed their own system.

Yes, crap support and next to no advertising helped contribute to the
demise of the ST. There still were a lot of STs about though, in the UK
this was about 1/4 to 1/3 the number of Amigas, yet whereas Amiga games
software sales account for 25% of the market, the ST share is neglible
(1.5 to 2%). That smacks of widespread piracy to me.

> The only reason these software companies were pointing the finger at
the >Atari community was that the sales
>of software didn't amount to any decent profit so of course they are going
>to pick on the little guy.

Why didnt Atari software sales amount to much then? - PIRACY!

> How come I can go into almost any store in the USA, and see, or even
>purchase a Jaguar but I haven't seen the A1200 or the CD 32 except in mail
>order catalog. Answer me that bright boy!!!!

Possibly because the CD32 isnt yet on sale in the USA. Just as the
Jaguar isnt yet on sale in the UK (and wont be until june/july either). As
for the A1200, just how many stores sell the Falcon either?

> Also, ask anyone thats not
>around computers or don't know too much about computers, to see if they
know
>what the A1200 or the CD32 is. But if you ask them if they have heard of
>the Jaguar most likely they will.

The Jaguar is a games console, so comparisons with an A1200 simply
arent valid. The Atari COMPUTER line is pretty much unknown too. As for
visiblity, the most widely heard about system will be the 3DO, with the
Sega Saturn following close. The Jaguar has supposedly been out since 31st
October, yet I dont see much sign of it setting the console world alight.
How many games in the 4 1/2 months since its launch? 4, 5?

> Yes I'm an avid Atari user and I love my machine. I am really
>pissed-off when you say that it was the Atari owners pirating the software
>that killed the Atari computer. What proof do you have to back this
obscene
>statement?!? Your probably one of those people who talk out of their
ass!!!
>So until you can back up what you say then you are totally wrong and

inane!!!

Like it or not, if more Atari users had BOUGHT their games instead of copying them, then Atari might still be a serious force. As for serious software, I`d say piracy is no worse than on the Amiga but as the Amiga has many more machines installed, then it makes a more attractive market for publishers.

Gavan
PS The Amiga market in europe is still thriving, of course in the states it is a different story but at least US amiga owners can benefit from the hardware and software developed as a result of the European popularity.

Precisely why we shouldn't lower ourselves to his level. Anyone who gets annoyed by this idiot's inane ramblings should mail his system administrator and complain to him/her - if enough of us do it, the sys.admin. will want some peace and hopefully will come down on Mr. sinclap like a ton of bricks. Just a thought.

ObAdvocacy: Doom on the Falcon. Under development (in parallel with Doom on the Archimedes (ARM3 only)) Got the decode for .WAD files done, got quick texture mapping routines up and working. Just wait (and any A1200 owners wanna have a go!)

Cheers

You keep talking about "choices", Peter, but what exactly is it
that you do with your Mac? Word process? There are plenty of
word processors in the Atari market. DTP? How about Calamus
or Pagestream (not to mention Fleet Street for the casual user).
MIDI? I won't try to list the music programs available on the
Falcon. What is it that you can't do on the Atari, Peter? Tell
us here on the Atari group and we'll point you to a package that
will fill that need.

Peter, with the cost of the system you have to take into account
the cost of software on the Mac compared to the Atari. On the
whole software costs much less on the Falcon. Of course almost
every Mac user I know pirates most of their stuff....

Ever heard of freedom of choice??? Just because everybody tells me that Coke is the real thing and Pepsi is the choice of a new generation, does that mean I can't drink Dr. Pepper??? (Ok, bad comparison as all of those products are easily available and supported) The point is, some people just prefer to use Atari computers and we don't need you telling us how many other people prefer otherwise or all the lack of support/software/market/etc that we have to deal with. It is very annoying to see you advocating Macs here when this is the Atari advocacy group. If you want to dispute what someone else says, that's fine, but keep the pure Mac hype to yourself. If I was interested I would go look for it in a more appropriate group.

I know I shouldn't have responded to 'the clap', but this is for everyone. I am really getting tired of being told that I don't have the freedom to choose the platform that I like and that I have been able to put to good computing use for the past 14 years (well thats 8-bit plus 16/32-bit platforms). No, you really haven't removed my freedom of choice, but constantly badgering us about the situation is as good as saying I shouldn't be able to choose Atari even if I want to.

Carry on....

>price) while a decent configured Falcon sells for $1299.

A brand new machine:)! Cor! Dead sexy. Except, of course, that users
who depend on reliability and functionality will stick to their old
UNIX boxes until the new hardware/software is completely debugged. A
businessman who employed me as a consultant to inform him of the best
way to set up a live internet site has just been knocked back by his backers
`cause he *had* to specify `power mac this, power mac that' when his backers
knew that new hardware and software can take a couple of years to settle
down.

>Thanks, Friedemann

It seems to be true. Atari Germany closed their doors.
But why not ? What can they do in Germany at the moment ?
They don't have any new computer coming out, so they moved
to Rotterdam (that's waht I've heard). Maybe they'll come
back when the Jaguar's is really avaiable in Germany.

But another thing: I heard that Commodore Australia has closed ?

What's the hell is going on in our old loved 68000 market ?
Will both Atari and Amiga owners loose against the PC even
if they know that they both have better systems ?

I'm primarily in the field of composing and sequencing music, yet I'd quite like a computer to write up my thesis on. I would like you people out there to give me some plus points for the Atari.

The main advantage I can see is that they're dirt cheap second hand, which is good for my limited budget, and there's lots of music software out there.

But how are they in terms of compatability with PCs? I'd quite like to be able to write on the PC at work (WP5.1 and AmiPro) and also at home on my machine (possible a 1040ST). Is this possible? Should I just forget it and save up for a PC (eurgh)?

Please inform me!

Thanks in advance

I'm looking into different computers, and would like some basic info on the Atari ST and whatever else they're up to now (Falcon?).

Last time I looked at Atari was in the early '80's. Alot has changed since then, I'm sure. I'm having trouble even finding Atari's for sale...Please help!

Thanks. :)

If your in the US, I'd say forget it. Unless you want a machine for MIDI, you'd do much better to buy somthing else. It's different in Europe where support for the Atari computer line is much better ie you can go in a shop and buy one. Personally, I have an Atari Falcon which I am extremely happy with but I have the advantage of being in UK which has some good dealers/importers.

The Atari computers are unfortunately in a state of decline right now and I can't see that changing in the foreseeable future. If you already had an Atari I'd say stick with it and upgrade to a Falcon or whatever but if your starting from scratch, think again. There is an FAQ posted in comp.sys.atari.st fairly regularly.

For MIDI, you can't do better than buy an ST. You'll probably need a mono monitor too to use the STs hi-res mode. As for files, the ST can read 720K PC floppies. If you use an ST word processor like Papayrus (available from Hisoft), you can read/write RTF format files which a lot of PC packages can also read/write. (windows).

There are some quite good bits of PD MIDI software such as sequencers, patch editors etc. I expect you'll have to pay for scoring software but I could be wrong here.

> purchase a Jaguar but I haven't seen the A1200 or the CD 32 except in mail
> order catalog. Answer me that bright boy!!!!

The simple answer is that Commodore and Atari have chosen completely
different market. At the moment the Jag is a complete unknown in
the UK compared to the US. It is not possible to buy a Jag without
resorting to mail order. The same is true for most of Europe as well,
as Atari have stated they are holding off a UK/Europe launch to
concentrate on the US.

Likewise C= are concentration on where they do best. It is possible
to buy a CD32 here without problems, and all electrical stores sell
A1200s (a new pack has just be launched).

In a `has my mother heard of it test` she had definitely not heard of
Atari`s Jag, but had seen plenty of A1200s around and remember the
CD32 from the TV ad campain.

> Your probably one of those people who talk out of their ass!!!
> So until you can back up what you say then you are totally wrong and inane!!!

That makes perfect sense. Not.
Anyway, the STs time had come as the Amiga became much more fashionable
to own. There just wasn`t enough continued development on the ST to
keep interest at a reasonable level.

Yes, what you meant to say was Amiga software is generally very
reliable and works with practically all configurations of hardware
and operating systems (which is almost entirely true - there are dozens of
different chips and OS revisions and most Amiga software can be convinced
to run on any hardware if you try hard enough).

You were not trying to imply the Amiga was somehow at fault at
a deeper concectual level.

Is that so, Gavan?

I wouldn't discount Ataris too quickly.If you know what you want
to do with your computer and the Atari does it than it is worth
considering. The Atari line right now is mainly the Atari TT
and the Falcon030. There are two Atari US magazines right now
(although I've heard that Processor Direct has started up as well).
Pick up a copy of one of these mags (Current Notes or ST Informer)
and flip through them. Where do you live? If you are lucky enough
to live near an established Atari dealer than you will get good
support. Otherwise mail order is the only alternative.
I am biased, but the Atari is the best machine on the market in
terms of having fun computing, IMO. Certainly more fun than a clone!

For writing and MIDI you really can't go wrong with a simple
ST! The great thing about it is that the ST and IBM clone's
disk formats are the same and so files can be tranferred to
each platform as easy as sticking the disk into the computer.
Just save your IBM files in ASCII or RTF and read them into
your ST!

No, piracy didn't kill the Atari - it certainly hurt it but it wasn't the main culprit. That special honor belongs to Atari itself!

Far too many companies have under estimated the power and influence that an effective marketing and advertising program can have in their markets.

Marketing, if done well, can bring sub-standard products to the forefront (i.e witness the success of the Apple II series even after they were obsolete or MicroSoft and Windows, etc.)

Commodore-Amiga made many mistakes in marketing during the early days of the Amiga (like positioning it as a business machine) and almost folded as a result. When they used their brains, they were able to make the machine a success, etc.

Atari had a great product in its hands - it was cheap and powerful. However, after the initial momentum of the product waned, they didn't spend the capital necessary to keep the ST line in the hearts and minds of the public. Simply, they had the opportunity and blew it!

Remember, up until about 1988, PC clones were still too expensive for the average home user - Atari could have expolited that fact and made Atari known. I remember when Atari actually advertised in mags like Compute! - then they got cheap and just decided to peddle hardware and ignored the other 3 P's of the marketing mix.

In business, you only get one or two shots and Atari missed them all...The Jag is a whole different story...lets hope they don't blow this one...

As for piracy - sure it did damage. I had a friend who used to have suitcases of ST games even before they hit dealer's shelves. I remember the hacking groups like the UNION, MCA, the BladeRunners, etc.. But, the AMiga has (had) its share of them too. I had more friends with Amigas and they pirated like fiends...

Just my two bits on the subject as both a marketing student and Atari owner.

Ari

P.S. I like my Falcon - nice machine but three years too late and about $600 too much.

Not true. It depends a lot on where one is in the US and how much truly
minimal effort one is willing to put in. The Bay Area (CA) has several
stores, most of which are ATari specific. My best suggestion would be to
get a Falcon and a GEnie account. Product support via "conventional" means
may be slow, but all the big Atari developers are on GEnie, as are several
Atari employees themselves. It is true that shopping before you buy is
difficult in some areas.

No, they aren't in decline, they are in hibernation... Things will get better,
but probably not soon enough for most people...

Atari UUCP : UPoint-'light'

1554. The role of Atari in an IBM/MAC/PPC world

Newsgroup: comp.sys.atari.advocacy
Date: 1994-03-22 20:21:02 UTC
From: rappleye@felix.kodak.com
Message-ID: <1994Mar22.202102.6041@kodak.rdcs.kodak.com>
Source record: 17904

About six years ago I got an ST for home: CPU, color Monitor, and printer for under a grand, brand new, in the box, warranties, all that good stuff. This was at the time when a Mac Plus sold for two grand or more. Power with out the price. I felt that I had made a good choice. It soon became obvious that Atari, for whatever reason, was not going anywhere in the computer world. In spite of that my Atari served long and well with good cheap applications, tremendous PD SW, and a local user group (ACORN) that was fantastic.

There comes a time when you realize you've outgrown your ST and that Atari just isn't a player anymore. The focus now is on how to move from Atari to the modern platforms. This morning I brought an Atari disk to work with my kid's term paper on it. Stuck it in the Mac, yanked the file into Word, changed the font, and printed it. Five minutes tops (once I got some hints from you folks on how to read disks).

My wife has a pretty good size database going using something ancient called DB One. Once I get around to hacking the file format I'll import it into something modern. I'm going to continue to use the ST, but with the price of a Quadra (including monitor, keyboard, and printer) down to around $1300 and still dropping, you can bet that the Falcon won't get much consideration when it's new computer time.

My 'advocacy' of the Atari is in the form of coming up with ideas and methods to preserve the utility of what was (still is?) a pretty good machine for as long as possible. I'd appreciate hearing back from anybody who has already fought their way through the translation/transition issues.

Thanks for listening. e-mail to rappleye@felix.kodak.com.

No Mr Brown is correct.
The blitter is a two stage pipelined device -- it can't output data
faster than one word every second cycle. Thus under certain patterns
of DMA usage [vertical and horizontal blanking] a copy operation
will have the same latency as a clear operation. Of course the copy
operation will eat twice as many cycles.

Anyone know where I can find an ST Book? I had seen them advertised in various UK ST magz from a few months back (at Gasteiner?) - are there any left anywhere? (Stacy is just too darned heavy!)

: I have one, but it's broken. I think the problem is in the connections
: between the keyboard part and the display part. I get a screwed up
: display most of the time when I turn it on. I bought one and it failed
: after about a year of pretty heavy use. I sent it back to Atari and
: got another for a couple hundred bucks. When the second one broke after
: another year, I just stopped using it. I didn't want to spend another
: couple hundred dollars every year or so...
:
: Does anyone know how to open it up? One of these days maybe I'll do that
: and fix the cable. . . .
:
: Tom Marchant

Um, it'a real pain to open, but I'll tell you what I know...

1. There are screws under the rubber feet strips
2. The Portfolio screen plate (the plastic sheet that covers the screen
and says Portfolio 16 BIT PERSONAL COMPUTER is _removable_ It peels
off if you are VERY careful and can be replaced once you finish repairs.
-There are some screws under it if I remember correctly.
3. There is a screw on the interface port that may need to be removed to
get the system apart.
4. Take your time, be careful, and be gentle - the port is a very
repairable machine - our ports (my friends and I) have undergone repairs
from screen replacement (after having been sat on) to screen ribbon cable
patching, and even a little surface mount microsoldering.
5. The most common problem seems to be a crack in one of the traces on
the ribbon going from the screen to the main board - once you get the
port apart, you can test this by checking continuity between all the pins
on the ribbon.

Good Luck...

Of cource its a Mac, why should it not be? Thats correct that Apple had money
for advertising and is a reason that Apple takes the mac seriously than Atari
does with the Falcon. Another strong point in not considering a Falcon.

To say my mailbox exploded with letters of various levels of indignation regarding my reply, would be an understatement. Enough already!

OK, it *may* not be as bad in the US as I said. All I know is I see message after message here from US people saying how dire it is, they can't buy the hardware, they can't buy the software, loads of packages/products never even get to the States. With that in mind, I really couldn't put my hand on my heart and tellsomeone to buy an Atari in that kind of market unless they are willing to put a lot of effort into owning it. I still stand by that. I have regularly recommended Ataris to people and many have bought them but in this case, I do not believe it would be a good choice IMHO. I have been told by several people I am shooting them down in flames after they have put so much effort into Atari in the US. I'm sorry if you feel that way I can see it can be frustrating.

I DO love Atari, I've had a VCS, 400, 800, 130XE (2), 520STM, 4160STe, MSTe and now a Falcon. I've caused literally dozens of people to buy STs over the years. It's right for me but I felt that for the original poster, buying an Atari at this time would be wrong for them.

|> >The Atari computers are unfortunately in a state of decline right now and I can't

|> No, they aren't in decline, they are in hibernation... Things will get better,
|> but probably not soon enough for most people...
Semantics. Until/if they pick up again, you can only view it as a decline. Like it or not, PCs and Macs are dirt cheap. I can buy a 486 with 4Mb RAM and a 250Mb HD for almost half what I paid for my Falcon. The day of the 'home computer' is over. There will continue to be Amigas, STs and Archimedes bought by various people for some time because some people like going against the system. I know I

do and when I end up with a PC, it will be to the sound of me kicking and screaming. Unfortunately, as a programmer/analyst, I live in the real world and I'm not going to add to my CV with and entry saying "I can program TOS'.

How about graphics art? The mac is a much better platform for
graphics art then the atari. The mac has the processing power to rotate a
600 dpi, 24-bit, 640x480 image in a resonable amount of time. Not to
meantion ripples, blurs, tiling, etc which takes a long time on a 33 Mhz
040 mac. These operations are acceptably fast on my PPC but they would not
be on a TT.

How about multi-media? Can you buy a stock atari with RCA jacks and
video capture software? How many frames per second can it capture? How
long does a 040 TT take to compress 100,000 frames compared to my PPC?
These operations take speed and the TT isn't up to it.

How about scientific applications? Can the TT generate a 3-d image
based on a fairly complex equation and rotate it in real-time? How long
would it take to evaluate an integral to a high level of precision?

If you truly have outgrown your ST, then it makes sense to move to another platform. But, what is it that you can do on another platform that you can't do on the ST (as far as computing is concerned)? If it is just processing speed/power you need, there are plenty of upgrade options. I realize that it is much easier to live in the DOS or MAC worlds due to having more software that is more readily available, but as far as actually getting things done, the Atari line is perfectly capable (for general home computing needs anyway).

The thought of a platform change has crossed my mind plenty of times, but when I look at what I use my computers for, I just can't justify the change only to be 'more acceptable' amongst friends and have a wider variety of software choose from (I don't really need 20 different word processors to choose from, do I???) just down the street at the local DOS/MAC store. I have enjoyed my Ataris for many years, have a sizeable software library built up that does everything that I really need (most new stuff is just for fun), I don't mind getting support from other users and mail-ordering my software, and I really like using my ST & Falcon better than any other machine I have

used (I have used DOS boxes at work and currently use a MAC IIci).

Granted, I couldn't really reccommend an Atari to someone just starting out unless they had a specific need (like MIDI) and were willing to put up with the headaches, but I personally see no reason to switch.

Peter, you have to realise that a lot of people do not like Macs. This is
chiefly because of Apples patronising, limited and crippling operating system.
If the Amiga did not exist, then the Mac would be somewhere near the bottom of
the list of computers I would likely be using. The Falcon would probably be
quite a bit higher. I'm sure a lot of people feel the same, and no amount of
flaming by you is going to alter that.

Unfortunately, unless Atari makes a commitment to stay with the architecture the ST/TT/Falcon series will be doomed to a niche and orphaned status much like the TI-99/4a and the IBM PCjr were.

Sure, you can use many of the same devices (i.e. drives, disks, printers, etc) but without specific hardware and software support, the machines will outgrow their usefulness.

I couln't honestly recommend the Atari platform to a computing novice because they need their hands held by support. If something breaks they're often not industrious to fix it themselves. They want the ability to buy the software they want, when they want it, and the prices they want. They want the ability to take work home with them ,etc.

Unfortunately, the Atari line can't give them what they want or need. If you're an experienced/knowledgable user they are great machines and fun to use - but such people are the majority or the largest segment of the computer buying public.

I'm not fortunate to live in an area where I can drive to an Atari dealer... If it weren't for the nets and contacts throughout the Atari community I wouldn't of known anything about the machines.

Like it or not, the Atari platform is in terminal decline (all over!) - not just in the US where there maybe 20,000 active users but in Europe too.

Now, I enjoy my Falcon - and I have enough software and knowledge to make it worth keeping. However, in the long-term, unless things start hapening for Atari and their computer line, I'll be selling my $1500 Falcon system for $200 at a local flea-market in a years time!

I hate flaming the Atari platform - I really do...but at least I'm being honest. Hey people, stop getting so upset about whether someone insults your Atari! Big deal! It's only a machine!

This board should be for real Atari oriented issues not for the "na na, my machine is better than yours" BS! The Mac people don't belong here, the PC people don't belong here and the Amiga people don't belong here.

Heck, I've used or owned all of those machines and I didn't like 'em but it doesn't mean I have to go to a net board and tell everybody so!

Let's try to return to the purpose of this board, ok?

Ari

There are proffesional Photo-manipulation packages available for the TT.
From what I hear they are comparable to stuff like Photoshop on the Mac.
I think Retouche Proffesional is one of em' (I believe there were some
articles on it in Current Notes last year. They are quite expensive though)

> How about multi-media? Can you buy a stock atari with RCA jacks and

No it is not as fast as your PPC but is plenty fast enough compared to the
other 680x0 Macs.

:If your in the US, I'd say forget it. Unless you want a machine for MIDI, you'd
:do much better to buy somthing else. It's different in Europe where support for
:the Atari computer line is much better ie you can go in a shop and buy one.
:Personally, I have an Atari Falcon which I am extremely happy with but I have the
:advantage of being in UK which has some good dealers/importers.

Melinda, you should figure out what you plan on using your computer for first, then see what computers are available to do what you want. A computer is only as good as what you can get it to do thru software. When you've decided what computers are best for your purposes, then you can figure out price, quality, reliability, availability, etc.

As Iain has said, Atari computers is very scarce in the U.S. The two major players are PC clones and Apple. Amigas though available, are somewhat hard to find and remain a distant third in the U.S. market.

Hmm, a 600 dpi image at 640x480? That's about a 1" x .75" image I
guess...

There are some pretty powerful image processing programs for the
Falcon, and they won't cost you $500 either! Sure a professional
needs that kind of speed, but for the casual user slower is OK.

Nope, video capture is the one area Atari is short on... but if I
wanted to do that stuff, I'd buy an Amiga!

>
> How about scientific applications? Can the TT generate a 3-d image

Longer than on the PowerPC, of course... but there is software to do
it.

Enjoy your PowerPC - I know I'm enjoying my Falcon,

For one thing, traditional dealers do not have a wide selection of software to offer. Each month I receive catalogs from MacConnection, MacWarehouse and MacZone offering the latest software with specs, ect. Plus I get great prices and is delivered to my house overnight for $3.00(regardless onhow many items you have bought) and a money back no hassle guarantee.

I also have a Campus reseller where I can try out the latest hardware. Can't be said for Atari. Apple sends their marketing droids at least twice a year to sponsor a min Mac expo in my student union. Can't be said for Atari.

How about Quicktime, and other multimedia software and hardware that is lacking and or non existent on the Falcon. How about cdrom support with hundreds of titles. Sure you can use a cdrom on a falcon, but is not a Company supported standard and a miniscule number of titles. Plus the Falcon uses a slow 030 and is only $300 less than a Powermac 6100 with raw speed(64 bit bus)

Can you buy these packages now? Why are these packages not piblicly known. If I was a proffesional graphic artist, I would want reausurance on product reliability, availability and schedule improvements. Graphic Artists would find the Mac appropriate than the Falcon due to the fast speed on the fastest 040 and PowerMacs.

The future of computing is in the power pc chip I believe. Mac thinks so, so does IBM. I hope Atari is joining the party. Imagine a day when we could run Pagestream next to Filemaker Pro and Sound Tools.
I think that unity is definately the answer. The problems we face as Atari owners stem from market share.
Bill Gates wants to put Windows on every dishwasher in America. To this end Windows has been ported to almost all OS's. The concept is there, any Windows program runs on any platform supporting Windows.

Now along comes the New Boss, Same as the Old Boss. IBM is farther ahead of the game I suspect than we can hope to play. The Power PC Chip, now theres something I can live with. Buy a power PC pop in an Atari add on instruction set and you now have access
to expansion slots, sound cards, more software than you can use and Atari developers have a larger market to sell to.

In response to my comment that the best way to deal with sinclap would be to complain to his sysadmin about his complete lack of netiquette (and I must apologise in advance for my propagation of a flamefest) I received the following, somewhat incomprehensible, post.

>Trying to cut off debate. Can't stand the fact that you are in the minority.
>I forgot you UK people don't have the Bill of Rights. I have done nothing
>wrong here, thats why there is advocacy..

Of course I'm in the minority. I'm British. I own a couple of Ataris (and also an Amiga and an Archimedes and several more vintage computers). No Macs (I've never felt the need to let my computer think for me) and no PCs (why, I'm not sure. Once you've binned M$-DOG and installed Linux, they aren't bad. And cheap peripherals too). I vote Labour. And I do believe in free speech - it's what this forum (and I use the word in its original sense), among others, is about. But I am also capable of discrimination between arguments on the basis of inherent value - while I don't deny sinclap's (or anybody else's) rights to stick their tongues out and go "My computer's better than yours so yah boo sucks" I do feel that the constant clogging-up of switchers and routers which are already strained is tantamount to vandalism.

Historical note - the UK does have a Bill of Rights. It provides (if I remember correctly) for the separation of Church, Crown and State and dates back to the reign of James II and the Glorious Revolution (anybody like to correct me on this - my historical chops are more than a little rusty)

Could we also please continue this by Email or in alt.flame, to avoid interrupting more reasoned arguments.

Cheers

Hasn't set the console world on fire?? What planet are you on. T2K has got the highest rating ever for a game in several magazines, they have sold 120,000+ Jags a matter of a month or so into full rollout and this despite heavy production problems. There are back orders so big the European launch has been put back twice.

|> software companies will spend big bucks redeveloping software for the
|> jaguar when their coders have to learn a complete new system? Thats why
|> there is so little support for the jaguar, and why there is so *MUCH* for
|> the CD32.
I'd hardly call 89 companies 'little support'. There will be a lot of games very soon. It takes time to code a game as you well know, that's why there have only been a few so far. What's coming out looks very good. There are *loads* of titles on the way.
As Jeff Minter has already said, the jag is easy to code for if your used to assembler and in a few days you can be coding some awesome effects and graphics.

|> **IF** the Jaguar were to sell millions this wouldnt be a problem, but
|> given that Atari market it (meaning market confidence is ZERO) then this
|> is the main reason why the Jaguar will most probably sink into obscurity
|> along with the Lynx and the Falcon.
If you really believe the Jag will fail then you have an amazing ability to filter out what is going on around you.

|> Still, maybe if you keep saying it will be a success, that will make it
|> so...
I don't think Sega need to start worrying just yet but the Jag will surely put Atari back on the map.

I generally agree with Gavins observations here. The Power Macs only run Mac software at a fairly slow speed compared to native PPC software. Ditto for Windows 3 stuff. Plus, the WIndows 3 emulator is naother 500GBP or so on top of the basic price. On paper they look nice but the reality I suspect will be somewhat less, in the short term at least. Once some decent native applications appear, it may show it's true abilities but until then it's just away of running Mac/PC software slowly.

You don't need 680x0 technology to do that. I can pull my TI-99
out of the closet, my a sound chip (sony OK?) and build a SCSI port and
it could do all the things that you mentioned above. It might take a
little longer to do a 10 pass gaussian blur and it might take a while
to manipulate the sound but hey, you can do it.

S> Atari should come out with a Power PC ST for their customers that could
S> offer
S> features missing on the powerMac such as MIDI. Are you listening Atari?

They will ... as soon as they profit from the Jaguar they will enhance their computer line, and when reading what Bob Brodie says carefully, one easily sees that it's PowerPC they're looking into ..

I'd say wait 1.5-2 years .. that's the time when PowerPC will start to take over the Intel-PC market, and that's when Atari will have earned some money on the Jaguar and begun developing PowerPCs ..

S> Yea, I hope not. I would rather have TOS than Windows anyday.

I really really hope we'll see MultiTOS running on an Atari PPC603 based computer .. Falcon compatible in graphics and sound (though added 24bit modes etc in the graphics area, as Bob Brodie hinted when he said "future Atari computers will definitely have 24bit graphics") ..

S> Again Atari are you listening? Would Atari users but a Power PC ST?

I assume "but" = "buy" .. Well, not a PPC ST ... but a MultiTOS PowerPC (with the above Falcon compatibility) ... you forget Peter that the Falcon is a *WONDERFUL* computer - but without the big software support of the PCs .. (I consider the Falcon to be THE computer for anyone who likes to program and hack together things himself ...)

Who will go out today and switch his/her Amiga/Atari for a 486? Not me .. I expect my Falcon to keep me floating until I can buy a PowerPC ... because I will buy a PowerPC, no matter if it's from Atari or IBM ... I will however NOT buy a PowerMAC if it's not 110% compatible with the rest of the PowerPCs and *NOT* running System 7 or something as stupid ...
The only thing I find weird is the TOTAL lack of "Amiga PPC" talk ... I mean ... does ANYONE really believe the AAA chipset will sell Amigas instead of PPCs???? Me thinks Commodore will cease to exist within 1-2 years if they don't do something ...

I want to do Virtual Reality on a PowerPC .. now ... anyone wanna give one to me?

Thank you for correcting me on ClarisWorks. I must admit that I have
no experience using it. My question was not meant as a flame and I
thank you for telling me more about ClarisWorks.
I apologize if I have given the impression that I think of Mac users
as "filthy pirates." I know pirates on all platforms (yes, even
Atari). However, I posted this messege out of frustration from the
responses I get when pointing out the low cost of Atari software.
Most Mac and IBM users will laugh at me saying, "You mean you actually
pay for software?!" I feel that Macintosh software prices have
encouraged piracy. While I would never pay $895 for Photoshop, I
might pay for Studio Photo at $99. While the initial investment
for Mac hardware is less than the Atari on some models, this difference
is quickly eliminated by the cost of Mac software (assuming that
people pay for their software).
I have a question about the Performa.... is there a way to get around
At Ease?
I would like to know other packages that you use, Peter. So far it
seems that we've payed about the same money for our systems. You have
listed word processing and communications software as your main
packages. Neither of these needs are better filled by a Macintosh,
IMO.

>is $100. You can also get mac software cheaply too.
>Hell i paid about $70 for WriteNow 3.0 and Version 4.0 sells for under $60
>mailorder plus $3 for over night shipping.

I can also get Pagestream or Calamus 1.09n which I think is every bit
as good as PageMaker...

What hobbies? How about programming - The atari is an execllent
platform for this, with a good unix environment and all of the Gnu
stuff at hand.

For sound & music, there is a lot of good, free midi and sound software around.

I can also get Atari WP's as good as WriteNow for about that much or
less...

Also, you forget the Added-Non-Mac bonus - it does not rub me the
wrong way!! I don't want to have to use "ctop()" or whatever call to
convert all of my C strings to pascal strings when programming. I
don't want to have to live with shoddy multitasking at its worst.

The problem with your cheap Mac software is that I can get stuff in
almost any area just as good on the ATari, probably cheaper. If you
want to say "The mac has the programs that the Atari cannot compete
with, then fine... but you totally neglect the fact that these
programs cost many many $$$$.

>
>I hate to burst your bubble, the Mac is a much better price and value compared

Apple sold over two million Macs in the USA market in 1993. Apples worldwide sales of Macs amounted to 3.5 million units. Apple Europe had sales of $2 billion, while Apple Pacific was about $1.6 billion. These figures came from the Wall ST. Journal and Apples 1993 Annual report. Apple sold estimated 800,000 Macs in Europe...

I am interested in knowing if the Jaguar, by Atari will sometime

have the game RYGAR released for it. I know that the atari portable

system, Lynx had Rygar and I am really interested in playing it on

the Jaguar. If you have any information please

Email me at : mdfitzge@eos.ncsu.edu

Thank You

Fitz

A few observations:

1) Mac users usually don't start violent uprisings.
I have never know a Mac "user" who knew much about anything
about the hardware inside.
So, when I see a "mac" person flaming another platform...
I have to wonder...what an IDIOT.

2) IBM compatible people are closed minded people who either
a) know less than mac people do about their hardware
b) BELIEVE they know hardware
c) acutally do know their hardware (very rare..must have a DEGREE)

3) IBM'ers have always flamed Atari.

4) Commie's have always flamed Atari, Yet I have more respect for
an Commie user anyday than for an IBM user.

5) The Jaguar is a good machine. I am going to buy it just to play
T2K. That's right...I am slapping down $300 for it.

6) I would never consider buying a 3D0 ..even if the Jaguar FAILS...

7) Nintendo? PLEASE...half the damn kids who play it have no
grip on the history of the industry. And I hates ignorance.

8) Sega... okay..pretty damn good system... its the ADULT version
of Nintendo.

9) I really hate walking into a store and seeing <13 year olds
all talking about which is better ...the Sega or the Nintendo..
and about how dady is bigger than other dady...and how this
machine kicks but...its a "real" machine.

10) previous children should stop reading such fish wrap magazines
and buy an entertainment system such as the Jaguar...or atleast
an Amiga.

11) Atari does NOT = 2600

12) Atari Users are slightly more well rounded and open minded than
most other platform users... except maybe unix users.

13) Please feel free to flame me...for I will chuckle at your
feeble attempts.

You're right, a 486 machine is cheaper than a PowerMac, but slower.
PowerMacs are competing with Pentium machines and generally are
cheaper. You can walk away with a store bought complete system
for under $2,000.

Compare the best decent mail-order Pentium with a street price
PowerMac and you'll find PowerMacs are a reasonable deal.

Macs outsell Amiga and ST in the US, Amiga and ST probably outsell
the Mac in Europe.

But total both sets of sales for total world wide. I wonder what
those totals will be? For the Amiga and ST to be higher they need
to ship between them almost 4 million machines a year.

Atari makes some fine machines which sell well in Europe, but I
don't think they sell 2 million a year there.

Steinberg has just announced a 16 channel Hd-recording version of Cubase Audio. And ofcouse it's for the Falcon.
Even better, Steinberg just downed their prices due to this new 16 channel version. And ofcouse it's for the Falcon.

Yo mr. Sinclap. This leaves the Falcon in the front on the music line. Just so you wont forget it. You seem to live in a dream world!

And once again i have to tell you. Atari produced the Falcon not Apple!

Oh, and btw. How about an 2 channel digital 8 channel analog output expander for Cubase Audio.. And guess what, it's for the Falcon.

I guess you don't even know who Steinberg is, and probably never heard of Cubase before.

Eat this!

Kim

COMMODORE SAYS IT FACES POSSIBILITY OF LIQUIDATION
Wall Street Journal, March 28, 1994 p.B4

WEST CHESTER, Pa. -- Commodore International Ltd., a once highflying personal computer maker, warned that it is on the verge of collapse and could be liquidated unless it secures new funding.

In releasing a quarterly earnings report, the maker of the Amiga computer said it is attempting to negotiate a restructuring plan with creditors, including suppliers that have sued the company. The release did not describe the nature of the lawsuits, and the company did not make a spokesman available.

In its earnings report, Commodore said, "In the absence of additional resources and a restructuring, the company may become subject to reorganization or other liquidation proceedings."

Commodore's Amiga PC, first released in the mid 1980s, never caught on among mainstream computer users, though it was praised by computer magazines for its easy-to-use features.

For the second quarter ended Dec. 31, Commodore had a loss of $8.2 million, or 25 cents a share, compared with a loss of $77.2 million, or $2.33 a share, a year earlier. Revenue fell to $70.1 million from $237.7 million.

Commodore stock fell 12.5 cents to $3 in New York Stock Exchange trading.

>articles on it in Current Notes last year. They are quite expensive though)

Ahh, but they're cheap compared to MAC soft - one reason many people can't
afford MACs, apart from they're a dog to use ...

Hell, I prefer WinDoze to System/Finder ...

>> How about multi-media? Can you buy a stock atari with RCA jacks and
>>video capture software? How many frames per second can it capture? How
>>long does a 040 TT take to compress 100,000 frames compared to my PPC?
>>These operations take speed and the TT isn't up to it.

Since when can you compare a 68030 with a PPC601!? Or even 040 for that
matter!? RISC architecture is totally different, heaps more efficient, and
even the guys at Motorola have said that the 680x0 series is now defunct
(although they added that the 68060 is coming out soon ...)

Really? I`ve seen 486 machines advertised in American mags for around
$900 inc 4 megs/monitor/hd. How much do Power Macs cost?

> As for the emulation, that was to remain compatible with existing mac
>software until lots of native apps arrive in the comming days, weeks and
>months. Hardly any PC software takes advantage of the Pentium.

The POWER Mac isnt really a MAC at all - its an entirely NEW machine
that comes with some software to EMULATE a macintosh. Apple has been very
clever marketing the machine as a macintosh, but in reality its just
another new box with a powerful CPU. The mac has been around for years and
sold millions, but it still doesnt have anything like the range of
software for the PC. You think that suddenly everyone is going to switch
to the Power `Mac` overnight just because of a clever marketing campaign??

ALL PC software will run at its fastest on the Pentium. Show me a
piece of PC software that will run faster on a 486 than a Pentium. Some
slight optimisation is needed to get absolute performance, but thats a lot
easier than recompiling your application to run on an entirely NEW chip
with no proven development tools.....

>> As for the mac
>>as being a Niche, your right but a very large niche market. I have
hundreds >>of
>>Macs on this campus along with an Apple reseller. Apple had
150,000Powermacs >>.on
>>opening day and sold out. The bussiness world is buying the powerMac.

I >>don't
>>know if you are referring to the UK but in the U.S. its a different
story.

Any adverts I`ve seen for the power mac here major on its ability to
run MSDOS software on a macintosh! MSDOS/Intel *IS* the business software
market. Weve had lots of new, powerful chips and computers before but NONE
has captured the Intel market because they cant run PC stuff as well as
PCs! Just look at the DEC Alpha PC - theres a phenomenally powerful chip
but noone wants it since its no better than a fast 486 for running PC
software.

When the PPC can deliver better than 486 performance at less than 486
price **on existing MSDOS SOFTWARE** THEN it will capture the business
market. Until then, it just falls into the `nice architecture, shame its
not as good as my 486 for running my existing software` bracket.

Of course, Mac users tend to be technically ignorant. Just tell them
there is an amazingly powerful new chip in the Power Mac and they`ll go
out and buy it without taking the time to discover that for **running
their software** its actually slower than their Quadras.

>>>
>>> Could it be that this PowerMac stuff is just mindless hype from Apple
to
>>> try to save the Mac line - surely not!
>>>

>>No, but Apple has it now. What do you mean save the Mac line. Apple
sold
>>millions of macs in 1993. Alot more than Amiga and St combined. Will
AAA save
>>C=, probably not.

The apple macintosh is DEAD! Apple now make a new machine that
happens to have a software emulator to run older software. One of two
things now happens:

1) PPC601 is hailed as a success and everyone starts using them in
their machines - apple becomes just another CLONE manufacturer.

I`d like to see this happen since it means we might finally get rid of
the AWFUL PC/Intel/MSDOS architecture in favour of a properly designed,
modern system.

but more realistically what is likely to happen is.....

2) PPC601 fails after a brief period of success due to clever
marketing, submerged by the rising tide of cheap clock doubled 486s and
apple go under.

either way, the Macintosh as we know it is finished.

>'PowerMac - Does more, costs less....

Oh, so it will run MAC software faster than a Quadra then? Or PC software faster than, say, a 486DX/33? And it costs less than either of these machines?

Gavan

>quarther statement from last year, in which I am assuming Atari lost
>money.

What counts is machines in homes and software availability. Look at
3DO (whose stock was originally SKY HIGH!). Very few machines sold, but
loads of software in developement and about to be released. This should
pull its fat out of the fire. Why so much software? because money was
spent making sure games would be developed and the 3DO people really took
the time to convince software houses. Compare that to the lukewarm
feelings about the Jaguar from the main software houses.

>Additionally, Time Warned just purchased another 1.5 million shares of
>Atari, incresing thier stake in Atari to 27% or so, I think.

>WHere is the CBM stock? If the CD-32 is so very successful, why does
>the CBM stock sit like a rock at it's current price?

I`ve no idea and I dont really care. What matters to me is support for
my machine and right now I`m quite happy. Since when does the price of C=

stock have anything to do with the possible success or not of the Jaguar. If C= did go under (as you seem to hope so much for), then would it make the Jaguar more or less likely to be a sucess? NO.

>I just don't understand the drive you have to malign the Jaguar. I'm
>willing to admit te CD-32 has been a good success overseas, and I'm a
>pretty strong Atari fanatic...

I`m just making a pretty fair comment on its performance so far and looking at the past Atari performance in launching new hardware.

Does anyone have a definitive statement on no. of Jaguars sold? Last I saw the figure was 27000 for NY and SF in the pre Xmas season. Sales are always slow after Xmas and especially coming into summer.

Gavan.

>The only thing I find weird is the TOTAL lack of "Amiga PPC" talk ...

Thats not weird, Rickard. Unlike you Amiga owners tend to stick with FACTS and dont go around making things up because they think they would be a cool idea. Theres absolutely NO sign of any Atari PPC (or even 040 <snigger>) and all that has been said is an Atari engineer saying a PPC Atari is an option..

> I mean
>... does ANYONE really believe the AAA chipset will sell Amigas instead of
>PPCs???? Me thinks Commodore will cease to exist within 1-2 years if they don't
>do something ...

Hmmm, C= have just released some upgrades to the A4000 line. Some cheaper LC040s and a Tower system. They at least have the AAA chipset on the horizon. We`ll have to wait and see how this works out, but surely as an Atari owner you should be worried about the Atari line? I mean, what have they done to their computer line since the Falcon? There isnt even an 040 Falcon model and theres no definite plans for any new machines or chipsets. Seems to me theyve decided to go back to being a videogame console manufacturer and have abandoned their home computer line.

Now, an Amiga with 060 and AAA *would* kick Power Mac ass but we`ll have to wait and see if C= can ever deliver.....

Gavan

>> 486? Oh, you mean buying from a retail store? I can easily buy a good
486
>> system for under $1500 mailorder. What about the PowerMac?
>>

>You're right, a 486 machine is cheaper than a PowerMac, but slower.
>PowerMacs are competing with Pentium machines and generally are
>cheaper. You can walk away with a store bought complete system
>for under $2,000.

Are you saying the 486 is SLOWER at running **PC** software than a
power mac? If not, then its COMPLETELY IRRELEVENT as to how many mips it
can deliver as it cant run the software that they want faster than they
already can on a decent 486.

>Compare the best decent mail-order Pentium with a street price
>PowerMac and you'll find PowerMacs are a reasonable deal.

Compare how much PERFORMANCE you actually get on software and you`ll
find out you`ve wasted your money to get a toy that can do reasonable
emulations of a Mac and PC.

>some people say here. Speed varies depending on the application being run,
>but it generally varies between that of a 25Mhz 68030 (i.e., a Mac IIci)
>and a 25Mhz 68040 (i.e., a Mac Centris 650). [By the way, does Atari have
>an 040-based machine out yet?] In my experience, most programs run at
>approximately the speed of a 40Mhz 68030, while those that demand number
>crunching (i.e., Excel, rendering programs, graphics programs, etc) run
>faster. Every program I tried runs faster than on my IIci.

At the end of the day it is slower at running Mac software than a Mac
Quadra which costs a LOT less. Thats a REAL advance in computing ....

>As far as the Pentium goes, the PowerMac still holds the edge - and will
>for some time to come, IMO. A 60Mhz Pentium processor (running
>Pentium-optimized software) is roughly equivalent to a 60Mhz PowerPC
>(running optimized software and *without* a cache card). Add a cache card
>to that PowerMac and speed increases about 30% - which is more than enough
>to give the PowerMac an even more significant lead over the Pentium.

Adding a decent caching system will also improve the Pentium
performance. Its a fact that at anything >16Mhz the system RAM cant keep
up with the CPU, so caching will improve ANY fast machine. You still dont
mention how good the Power Mac is at emulating a PC .. not as fast as a 33
Mhz 486 I`ll bet. Lets see how the takeup of PPC601 chips is in the market
that **REALLY** matters - the PC compatible market.

>Currently, a 60Mhz PowerMac is the "slowest" one you can get, with the
>next step being a 66Mhz and then an 80Mhz chip in the top level Mac (and
>all can be equipped with the cache card for added speed).

Its also the ONLY PPC chip you can currently get. Pentiums will also
have 66 and 80 MHz clock speeds.

The difference is that PC owners will actually see an INCREASE in
speed over even the fastest 486 is they buy a Pentium (even more speed if
the software is Pentium optimised), whereas if they go for a PPC they will
get a SLOWER machine than their existing 486. (As will mac owners get a
slower machine than their Quadra)

What we have here is a case of Apple matching the Power of a
Pentium, but in doing so they have had to junk full hardware compatiblity
and the resulting software emulations only provide a fraction of the
possible performance.

PC owners will see a speed benefit in moving to a Pentium,
Mac owners will see a loss of speed in moving to a PPC.

Since the market IS for PC-software, I cant see the Mac grabbing any sort of market share with the PPC, except maybe in the extreme short term when clever marketing will hype sales. Once the press start showing the actualities of running your existing software on Power Macs I think we`ll see that the PPC601 at any rate is irrelevent to the larger market.

Lets just see what happens when (if) Motorola bring out the 68060. If the PPC601 is sooo wonderful and the way forward, then Apple *WONT* bring out a Mac with an 060, but my money is on the appearance of an 060 Mac as soon as they have the chips......

It is traded on the New York Stock Exchange. On the "ticker" listings (the ones that go by on the bottom of the screen on stations such as CNN Headline News) it is "CBU". In most of the NYSE listings, it is "Commdre" or "Cmmdr" or something like that.

Don't go looking for it, though, as it has be delisted. I couldn't find the stock listed anywhere.

>No, No, No!

>You are missing the point. A 66mhz 486 is _faster_ running DOS programs
>than a PowerMac. The point of emulation is to _TRANSITION_ over to
>native programs.

Actually, you are missing the point. **IT DOESNT MATTER HOW POWERFUL
THE PPC CHIP MIGHT BE** as it isnt faster for PC stuff than the existing
Intels and clone chips. There have always been better systems than Intel,
until the recent spate of cheap clock doubled 486s even the standard macs
were faster than PCs but that didnt matter. The business market is tied
into IBM PC compatibility.

From the PC users point of view with masses of industry standard
software titles, how many of these will EVER be available as native PPC
apps? Of course, Mac users have a smaller base of titles and with apple
commited to the PPC chips then we will see Apple software manufacturers
convert their titles.

Relevence of power mac to the REAL business market - Next to zero.

>I will say that a PowerPC machine is generally faster running native
>than a similar priced Pentium running 80x86 code.

So what? Since Pentium just requires an Optimised recompile of existing
code and PPC needs the program to be compiled for a completely different
platform than the old code we`ll see LOADS of Pentium apps and all the PPC
will get is existing Mac apps ported to it.

To be a success it will have to capture the Intel market. If it doesnt,
then its just a fast mac which the great PC buying business community will
ignore.

>If someone has a 386, (which is a _lot_ of people) and are thinking
>of upgrading, a PowerMac may suit them. It emulates at similar or
>better speeds and holds the promise of faster than Pentium for less
>dollars. I would rather transition to RISC now, when my current
>machine is not so fast, than wait until I have a super CISC and there
>is no way to emulate that fast.

No, because they can upgrade to say a 66MHz PC for less than a Power Mac. They are unlikely to want to run Mac software, as they already have a PC and are tied into PC software.

You just cant accept that the Intel platform holds all the software cards. Sure its crap and creaky, but thats where the software is. There have always been faster systems than the PC but the PC has the trump card of being compatible with existing software. Its a stupid situation, but thats just the way it is,

If your logic held true, we`d all be using SPARCstations or even DEC ALPHA machines as they offer astounding power......

>If people are buying PowerMacs to emulate forever they are fools.

ha ha. Lots of Mac users seem to be buying the Power Mac because of the hype. No business is going to spend extra money now on the promise of faster software in the future. The smart thing is to wait, and if the PPC native software promises come off (and you actually WANT mac software) then you buy a PPC to run it.

>If someone belives that is the whole point of PowerMacs, they are also >fools.

The emulation was needed so that at least Mac owners would have some software to run. It`ll be a year or two before the Power Mac has anything like the range and variety of software for it native that the mac has now. And the Mac is just a niche market anyway. The action is in the PC market I`m afraid.

>Every week, new programs go native. By high summer, all of the major >Microsoft apps will be native. WordPerfect already is. Photoshop already >has a native drop-in. There is a lot of native shareware already. By the >end of April there will be over 100 major apps native.

So some Mac apps go native, so what? Will we see PC apps being xferred to run native on the new Power Macs? I doubt it.

>The native software is coming and soon this whole emulation issue will >blow away. This is not rocket science. if anyone has any doubts, come >back in 6 months and look at total PowerMac sales. I don't think Apple >will have any trouble selling them.

Its not going to blow anyone away. If you get some mac apps starting to run faster its not going to make a bean of difference to the wider market. The power mac is just a faster version of an existing niche machine. Mac owners will be pleased that they can get faster versions of their software (whenever the software companies get around to releasing a `native` version) but the main PC market will go on as it always has. In fact, since people can run a PC emu on their power macs they may well be tempted into the Windows software market...

Do you really think if C= or Atari had made a POWER Falcon or POWER Amiga that there would be loads of people rushing to develop for it simply because it was really powerful? Where are all the software companies

looking to port their wares to the DEC Alpha chip then? Why dont we see all the PC applications heading for Sun SPARC?

We`ve had a serious hype machine run by apple, but once the market takes a look at what the PPC actually offers them they`ll simply keep on buying 486s, like it or not.

Gavan.

carol@edfua0.ctis.af.mil (Andrew Carol) writes....

>I will bet you a dollar that in 6 months, more major applications will
>be PowerPC native than re-compiled for the Pentium.

ha ha ha! Only a MAC user could be so _stupid!_ Here are 2 MAJOR
points..

1) A re-compiled Pentium app is simply recompiling for the same
architecture with optimisations to allow for parallelism withing the CPU,
BUT
A native PPC app will have to be compiled on a completely new compiler
with a completely new target system - which do you think will be
easier?

and

2) Native PPC apps will be drawn from existing Mac apps BUT Pentium
optimised apps will be drawn from existing PC/Windows apps - which of
these markets has the most amount of software available for it?

>Do you not wonder why the entire Workstation world has gone RISC?
>Do you think IBM, Apple, Motorola, HP, SUN, MIPS, Cannon, SGI, etc
>are _all_ wrong about RISC?

Look, theres no question that Intel dont have the _best_ CPUs, but
that is where all the software runs. I dont see the workstation market
having anything like the prominence of the PC market, despite having much
better hardware and OSs than the PC. The best way to run the VAST amount
of Intel software out there is to run it on an Intel or clone chip. Period.

>I bet they sell a lot. In a few months no one will remember the
>emulation deal as everything will be native, and people will be
>happily out performing their neighborhood Pentium for a lot less money.

Irrelevent. For years you could outperfrom the PC with Mac, Amiga and
ST but the PC won out because of compatiblity. You can also emulate both
Macs and PCs with the Amiga and Atari but still the PC sells. Workstations
outperform the PC but there is no wide market for them. The market is with
Intel/PC architecture and thats that.

>Oh well. Please check back in a year!

Thats probably the best thing to do. I reckon the net effect of the
Power Mac is that Mac users will get better performance in the long run
(after putting up with emulation for quite a while) but that the PC market
will still march forward towards global domination as it has been doing
steadily for the last few years.

I dont own a PC so I have no reason to advocate them, other than the fact I recognise the way the market it going. In fact, after easter I will be going for placement work in an organisation that uses loads of Macs and which has a bundle of Power Macs on order, so I imagine I`ll be using Power Macs a lot myself. I`ll report back on my Power Mac findings if anyone still thinks that they have any relevence in the business world after the initial buzz dies down.

>> Really? I`ve seen 486 machines advertised in American mags for
around
>> $900 inc 4 megs/monitor/hd. How much do Power Macs cost?

>It's not competing against the 486, it's competing against the
>Pentium. It's faster than the Pentium and cheaper. Don't
>quote Apple list price against mail order street prices.

Its competing against MS-DOS machines for business. It will be
expected to run MSDOS and Windows software FASTER/CHEAPER than any
equivalent Intel x86 type machines if PC buyers are to go for it. Thats
why the DEC Alpha chip, despite having more raw power than a PPC601 and
despite running a 486 in emulation has failed.

The Power Mac will fail to capture the PC market. It might manage to
take over the Mac market, but since Apple already had that I dont think
its going to help them that much! Having more powerful machines as
standard might help to slow the erosion of the Mac by the PC though.

>Street prices of both machines put the PowerMac 6100 $200 - $500
>cheaper than a similar Pentium. Many fence sitters will buy
>on that margin.

PC buyers tend to be better informed than Mac buyers. They will see
that the can get about the same specinf/specfp for slighly less with a
Power Mac, but then they will realise that the delivered performance on
all their software is less with the PPC and will go for the Pentium which
(gasp!) will actually run all that software theyve invested in FASTER!
What a concept for a `next generation` chip, eh? The chances of PC
software houses rushing to produce Power PC/Mac versions of their existing
software is about the same as them rushing it out on OS/2!!!!

>> Of course, Mac users tend to be technically ignorant. Just tell them
>> there is an amazingly powerful new chip in the Power Mac and they`ll go
>> out and buy it without taking the time to discover that for **running
>> their software** its actually slower than their Quadras.
>>

>Unlike PC buyers who slavishly send Microsoft money for each
>useless tweek to MS-DOS? Or Amiga owners who pine for AAA,
>or Atari owners who, etc, etc?

Yes, but upgrades to MSDOS dont mean you have to run your older
software under emulation and AAA is backwards compatible with ECS in
addition to the improved functionality.

>I expect you to post how stupid Intel is to expect people to
>emulate when they announce RISC. You will won't you?

You dont seem to grasp the way the PC market is moving. What is happening is that there is a move to migrate software not (initially) to a completely new processor platform (as Apple is forcing with the Power Mac) but rather to move software development to a new OPERATING SYSTEM which is more machine independent. Hence, Windows NT which effectively runs your old Windows and DOS apps under emulation, whilst providing the potential for really excellent future development. Of course, just as the Power Mac will fail in its attempt to muscle in on the PC market, so Windows NT has had a slow uptake since for most people all that happens is that you get your existing software, slower! (sounds like the Power Mac to me!). OS/2 also falls down in the same way.

Even so, changing OS first and then porting the OS is a much better idea than forcing users to port to a new platform and then running an emulator for compatiblity. After all, that was one of the driving forces behind UNIX. In fact, this portability of software under Win NT could be the saviour of the PPC boxes. Of course, then PPC would be competing with all manner of processors such as the Alpha, SPARC etc and even other PPC boxes from rival clone manufacturers. So in the best case Apple gets a slice of the PC market but just becomes a clone manufacturer doing it!

>> The apple macintosh is DEAD! Apple now make a new machine that
>> happens to have a software emulator to run older software. One of two
>> things now happens:

>True, sort of. It is a new machine which will attract new software.
>The nice bonus is you can run your old software generally as fast
>as you could before. Remember, most people are upgrading from
>'386 PCs or '030 Macs. Those power users who had Quadras will
>just upgrade their software to native.

Why pay x to upgrade to a Power Mac when you can spend LESS on a Quadra and run your software faster. PC owners wont even CONSIDER a Power Mac as an upgrade since there is NO chance of seeing their software being rewritten in native mode and if they were satifisfied with the relatively smaller range of software for the Mac they wouldnt have bought a PC in the first place. Smart Quadra owners will WAIT AND SEE how much native software there is before deciding to commit funds to a Power Mac. GULLIBLE Mac heads will of course rush out and buy the Power Mac since the adverts told them to.....

>In 9 months this whole emulation thing will evaperate. Why
>did people buy Windows at first? All they could do was run
>DOS programs, but the Windows programs came. They will for PowerMacs
>also. Macs represent almost 20% of the computer market. They
>can't be ignored.

Windows only took off when it was included with machines, and after there was a decent array of software for it. It was around for years in versions 1 and 2 but was a total non starter. It was only once people

could buy Windows versions of their favourite DOS software that Windows really took off. And of course, Windows ran on the machines they already had - if you had to upgrade your hardware to run it you also got a faster machine to run your DOS software.

>> Oh, so it will run MAC software faster than a Quadra then? Or PC
>> software faster than, say, a 486DX/33? And it costs less than either of
>> these machines?
>>

>Can it run PC software faster then a 486DX/33? Not generally, but
>some it can come pretty close. _BUT_ can a top-of-the-line 486
>run any software faster than a PowerPC can native? I don't think
>so. Many power users want raw speed. The PowerPC promises to deliver
>that and cheaper. Even a good Pentium can't keep up for graphics
>intensive work.

People want a machine that runs established industry standard software better and faster. If they had been happy with Mac software theyd have bought a Mac in the first place instead of a PC. The PPC has no relevance to the PC market until it has better price/performance on existing PC software than Intel chips. ie Never.

>Either way it will be an interesting year. Care to
>place a bet on who has the fastest, cheapest computers
>in a year?

Care to place a bet on which platfrom will STILL be dominant in a year? I doubt that Power Mac will have much of an effect on overall apple market share.

>low pricing ..

REMEMBER, Commodore was the souce the the A1200 and Amiga CD-32 were selling so well. We just took their word as stone. And the people that heard they were selling so well decided to get them since they were doing good.

Commodore was stupid. They should have made the Amiga CD-32 cartridge based (with capability of expanding it into a computer) and allow game players to purchase a CD-ROM for it later. Let's face it, 75% of the games for the new Commodore products don't need CD-ROM.

Just think, how would the Amiga CD-32 do if it cost the equivalent of $200 American dollars in Europe??? Let's just put it this way... Commodore would have made it tough for any company that came into those markets next year.

I suggest the following things happen:

Atari Corp. hire Commodore's engineers before they are hired by another company.

A company make an Amiga emulator for the Falcon030 (since it will no doubt continue to be produced).

Atari Corp. purchase patents and operating system from Commodore.

Commodore owners hold onto their Amigas for another year until the shake-out in the personal computer industry happens. And to see which is clearly the better CPU... PowerPC or Pentium? And to see if Atari Corp. can capture some of that magic that Commodore users enjoyed when using their Amiga. (Both companies have similar computers... you can't argue that).

See how successful the Jaguar is which will determine how strong Atari Corp. will be when re-entering the personal computer industry.

I _WOULD_ say that Commodore and Atari should merge together, BUT Atari Corp. cannot afford to pay Commodore's debts. AND Commodore really doesn't have outstanding products left. The only thing Atari Corp. has that really may get the company going again is the Lynx, Jaguar, and games.

That's it.

Ok, after a few days of pondering I've come to some
interesting conclusions. Honestly, though, is C= UK hurting at all?!
It sounds as if the machines there are selling well (maybe not as good
as C= International planned), and C= UK are holding their own. Now,
how about this. Is there a good chance (or any for that matter) that
C= UK could separate from/or even buy out C= International? The UK,
being C='s best market, would be a key place for a world HQ. They
already have those ACE (sp?) stores starting to pop up everywhere,
and, IMHO, Dave Pleasance (sp?) seems like a great guy. It's really a
shame that the US market just plain sucks...I hope that C= can somehow
make it through. I want a CD32 damn it!

Not worth the effort. Who owns a Falcon030 anyway?

>Atari Corp. purchase patents and operating system from Commodore.

With what? Another cash advance from Time-Warner?

>See how successful the Jaguar is which will determine how strong Atari Corp.
>will be when re-entering the personal computer industry.

Prediction: Atari will never re-enter the personal computer market. Too much
HASSLE, low profit margins compared to video game consoles.

>I _WOULD_ say that Commodore and Atari should merge together, BUT Atari Corp.
>cannot afford to pay Commodore's debts. AND Commodore really doesn't have
>outstanding products left.

They have a line of proven sellers. Just can't afford parts to build them.

>The onlY thing Atari Corp. has that really may get
>the company going again is the Lynx, Jaguar, and games.

The Lynx is dead. I know, because I own one. Nobody carries them anymore. If
Nintendo would release a Gameboy with a decent, backlit display, the Lynx
would be out of here.

The Jaguar just might make it. I like it -- wish another company was
selling it. I'd hate to see it suffer the same fate as the Lynx -- great
hardware, some decent software, but lousy market penetration, lack of big name
licenses.

Hi,

not too long ago there was some discussion about splitting up the group possibly to 68030 and 68000 or to make new TOS newsgroup alternatives. However I am wondering if anyone of you are interested in creating a

comp.sys.atari.st.announce or maybe just plainly comp.sys.atari.announce

whichever..may as well stick to the st notation...(?)

The reason why I ask this is as follows, though there are quite a few new things released for the Atari concerning also commercial produce, very often so people do not like it...i.e. it is often frowned upon when people do press releases into a public newsgroup. This is why very often computer newsgroup have posted an announce newsgroup...so that people are more free to announce new stuff...basically invited to, and I think it is beneficial to both vendor and/or user. Also, he can of course choose not to read it...:) nothing unusual

Discussion would then be continued in this newsgroup if it was about an announcement..the announcement would be solely used for pure and simple announcing of any product related atari computers (or clones).

Watch'a all think?

Thanks for any input

Yat

ps: If this appears to create enough interest, i will go ahead and start

Yeah right..! The only people who will buy the CD-32 is Amiga fanatics. When they get their "cutting edge" console home what do they find ? All the games they bought were *exactly* the same as their 1200 games, just with prettier graphics........

They can't be doing all that bad. According to an article in the latest issue of A/V Video (production industry mag) as of January, Commodore international had announced the sale of 100,000 CD32 units. It also stated that there are indications that they may have actually sold 250,000, but are only admitting to 100K (I guess when you're in debt that far you don't want your creditors to know you've got a little cash). The Philipenes factory has been converted to 100% CD-32 production, (now at 22,000 per week). The Scotland factory had to be re-opened to take up the slack in A1200 and A4000 production.

Be seeing you...

>

There are TODAY more PPC native applications on the market than Pentium re-compiled programs. Watch this trend to continue.

The lack of Pentium specific programs after a YEAR on the market has not gone unnoticed by all the magazines.

Byte (and others) have observed little desire to make P5 specific code. It's only 20% faster. Existing stuff runs "okay" already. It requires two distributions because those speed ups often hurt 386 and while sometimes helping 486, often don't.

But there is an incentive to go PowerPC because the speed up is over 100%, and will be required to play in the Macintosh market. That is 20% of all computer sales. Microsoft makes huge earnings off of its Macintosh applications sales as do others. There is only one distribution due to "fat binaries", which increase size by between 30 and 60%, but allow the same app to run on 68K machines and RISC machines. End owners can remove the part they don't want/need (if they choose to).

By the end of the year, emulation will be a memory for most people. Then it's pure RISC scaling for a decade or more.

All Intel is doing is puting that day off when they must do the same. A time when emulation will be harder because we will be so spoiled on the much talked about P6.

On that day, will you feed your pro-80x86 line back to Intel and tell them that RISC is a goof, or will RISC magicly be okay then? All the problems you observed, will they just poof away?

I expect most sheep to bow down and say to Intel, "Thank you sir, may I have another".

Oh well.

So, the reason for posting to the 8bit group I assume is fishing for support
of an comp.sys.atari.8bit.announce group? Actually, I could see a plain
comp.sys.atari.announce group, since there have been a fair amount of releases
of new hardware to the 8bit community the past few weeks.

..the first ad I'd ever seen for the Jag. It was on MTV, no less.
(that's actually smart marketing!) this evening. Pretty slick ad, but it
was for Crescent Galaxy (actually, I admit I only saw the last few seconds
of it.)
If this market saturation will continue the jag will have to kick
ass.. we all know the average dumbass 11 year old kid knows nothing of tech-
specs, only what he sees on braindead television.
The JAG just needs more killer games NOW.. I'm sick of them rehasing
old games like Tempest.. Flame the 3d0 all you want but you can't deny that
Megarace is a wonderful game.. JAG needs a killer Tecmo Bowl or something
like that and the market is THEIRS..

look to the future..

Too late. We already got 'em all.

Martin Taillefer works across the hall from me. John Wiederhirn is
just down the hall. Spencer Shanson and Martin Hunt are in adjoining rooms.
Dale Luck has a nice view of the neighborhood pheasant. -=RJ Mical=- and
Dave Needle were last seen drawing diagrams on whiteboards somewhere and
muttering about chocolate, spicy chicken wings, and nocturnal temporal
compression. Stan Shepard works quietly next to where the Robotron-2084
machine used to be. Hedley Davis makes CD's spin in various interesting
ways, and Andy Finkel pops in now and again to change diapers :-).

They, myself, and over 250 other people are hard at work to make
3DO amazingly great.

(And yes, some of us have Amigas on our desks.)

"Old games like Tempest"? How many kids today have ever seen it?
It would probably be new to them. There's a lot of the old
arcade games which were well done, which people today would see as
new. Joust, Tempest, etc.

I would buy a JAG just for Tempest.

Exactly, people are actually SATISFIED with the level of performance
they are getting from the Pentium even without optimised software. Why on
earth would they want to go to an incompatible PPC and run everything
under emulation and get less performance. When a really Power hungry app
comes along there will be a Pentium version and when enough people have
Pentiums we`ll see Pentium versions appear as a matter of course. Until
then you can run ALL your PC software at speeds 50% faster than even the
fastest 66MHz 486. All thanks to HARDWARE COMPATIBILITY.

>But there is an incentive to go PowerPC because the speed up

Wow, so manufacturers are going to put all that effort and to
developing ports for 20% of the market when they can just keep on
enhancing their existing products which run on a platform that has 80% of
the market share? Give me a break! Since when does the Mac have 20% of the
business market anyway, wasnt it more like 13-14%?

And dont confuse the market share of the EXISTING mac line with that
of the Power line. Are you saying that the Power Mac will account for 20%
of the market next year????? With Intel shipping cheap pentiums, Cyrix the

M1, and more cheap clock doubled 33/66 or 40/80 or 33/99 DX clones than you can shake a stick at?

>By the end of the year, emulation will be a memory for most

I answered this in another post, the PC stuff is shifting OS to a more transportable system anyway. For the time being though, the best way to run PC compatible software is on an x86 hardware-compatible processor and thats the way its going to be for the forseeable future.

>On that day, will you feed your pro-80x86 line back to
>Intel and tell them that RISC is a goof, or will RISC
>magicly be okay then? All the problems you observed,
>will they just poof away?

>I expect most sheep to bow down and say to Intel,
>"Thank you sir, may I have another".

>Oh well.

I`m not `pro 80x86` - I`m simply observing the way things are. Like most fanatical advocates of `your` system, when that platform takes an incompatible step forward you seem to expect everyone to rush out and buy the new machine simply because of the potential it might have. Anyone spending money on a Power mac right now is gambling that it will (rather quickly) aquire a range of software on a par with the PC and that they will soon all be running their apps much faster than they ever could on, say, an Intel chip. For the huge majority of the market who own a PC this is just wishful thinking bullshit. Even for Mac owners, buying a PPC mac now means spending more now in the hope of `jam tomorrow`.

Just WHY should people/businesses spend their hard earned cash on a machine which doesnt actually offer any more speed on the packages that they want to run right now??

YOU may be so enamoured with the MAC line that you will rush out and support a new, unproven technology with your money but please dont expect the rest of us to be so naive.

IF the Power Mac turns out to have a huge range of super-powerful apps in a years time that can rival the PC software for functionality then terrific, I hope that it can take over from the PC line but the smart thing to do is simply to `wait and see` before spending your money. I dont think the Power Mac will fulfill even a half of the fanciful hype being spread by Apple and diehard mac-heads like yourself.

too
>low pricing ..

Yes, Atari with their policy of selling overpriced computers and
shifting only 35000 of them in a year had it right, whilst C=s policy of
selling the sort of hardware that users want at good prices and shifting
350000+ (in the UK alone) in a year is totally wrong........

Just tell that to any Amiga owner who enjoys a great selection of
hardware and software for their machine pricisely BECAUSE it is so popular.

Just WHERE is all this C= is dead bullshit coming from anyway? C= UK
are fine and the Amiga line (A1200, A4000 and CD32) is selling strongly in
Europe and has good software and hardware support. Looks like some Atari
loonies arent just satisfied at living in a dream world where Atari is
king, they now want to delude themselves that the Amiga is dead too....

Seek some professional help quickly, Atari-losers!

Commodore themselves have been quoted in the Wall Street Journal as stating sales
of CD32 in Europe have been poor although 1200 sales ave been good. CBM reckon
they have sold 100,000 CD32s, not 350,000 as you state.

|>Seek some professional help quickly, Atari-losers!
Gavan, Commodore *are* in a bad way. They aren't gone yet though. Getting abusive
just shows your nervousness. Why not do a bit of research before comming out with
knee-jerk reactions like this.

API, Newspaper, The New York Stock exchange. See, Commodor International ows
more than its worth and creditors are moving in and will start pressing
legal action. Plus there is the small problem of their stock dropping from
$3 to .35 cents.

>are fine and the Amiga line (A1200, A4000 and CD32) is selling strongly in

Yes they are selling strong. BUT its less than they need to survive. They
made a press release a few days ago saying that CD 32 sales were weak over`
christmas.

>Europe and has good software and hardware support. Looks like some Atari
>loonies arent just satisfied at living in a dream world where Atari is
>king, they now want to delude themselves that the Amiga is dead too....

Nope, it isn't a dream. While Commodore might survive, its looking really
bad. The fat lady is standing up and clearing her throat.

The US market doesn't suck the marketing and shiping sucks. I know
of many dealer that would love to sell tons of 1200's, 4000T's and
CD32's but can't get there hands on more than a hand full at a time.
Now how is the market supposed to be great if the machines are
hard to get and there is little to no service and no marketing
from C=. Give me a break. Look at the numbers, someone said 14,000
CD32's sold in the US from Canada before it was released in the US.
That is with no advertising. There is a wide market here people
just have to have the hardware and software and service to want
a product......

Me three. I wouldn't pay $600 for a game console, even one as powerful
as the 3DO. But a home computer as powerful as the 3DO, that's a whole
'nother story. (the thought of getting my hands on those millions of
polygons, hardware shading and texture mapping... *drool*)

Source record: 17706

Many of these 'facts' are wrong...

for example: Motorola now announced the 100MHz 601 PowerChip. But inspite the faster Pentium chip, this chip will probably be cheaper than the existing one - due to 30% less size than the slower ones (only Motorola can do such things ;-) And while probably most Pentium chips won't live for many years (as they are kind of a central heating) the faster PC will only use half has much as the slower ones. And what is even better: The Pentium in it's present design is the end of the line - while IBM and Motorola already said AND shown how they CAN speed up the processors by a factor of 4 or even much more.

You are speaking as if Apple has sold 'few' computers and is rather un-important. Well, there are running about 10 Million Apples now - versus about 80 Million Clones. Not too bad for one single company! And I'm sure, things get better with this enourmus speed up!

PC owners can profit more of the higer speed than Mac users? Well, I doubt that! While Windows is a hell of an OS (Still no desktop for copying files :-))) that uses much of the resources (in speed, memory and disk space), System 7 is nice, small and fast. And well designed. (I love the possibilty to switch the number of planes at any time whithout restarting all programs for example!).

Almost NONE? There's not even 486 software at the moment!

>I will bet you a dollar that in 6 months, more major applications will
>be PowerPC native than re-compiled for the Pentium.

One should not mix up the emulation (where the smallest PPC is as fast as
the fastet Quadra - or even faster (look at the tests)), and recompiled
programs. They ARE much faster without any change in the code. These
recompiled programs are available already next months - due to infos
from many big softwarecompanies at the CeBit.

Really re-written software won't be out that soon. But that's almost not
necessary.

>What happens when Intel pulls the same evil trick on you when they go
>RISC? That will be different huh? Watch for it at P7!

Do you think a machine with an 8 bit AT-bus would make a good
RISC based system? before using new CPU's they would have to do a
redesing of the whole PC-system. What would come out? A PREP system - like
the PowerChip based one :-))

How about making it into a computer? A games machine with no OS doesn't
do anything to help me recapture that ol' Amiga magic, regardless of
how impressive it may be ("may", since, living in Australia, I've never had
the chance to see a 3DO - I hope I will, one day).

True enough, Apple is pretty sturdy - the people who talk of the Mac
dying out if the PPC doesn't fly probably are thinking in terms of
many years (or should be).

>First, speed (and in comparison to the Pentium). The PowerPC chip (in the
>Mac) has two modes: A native mode, and an emulation mode. Under emulation
>mode it'll run all existing Mac software. It's not "pitifully slow," as

>an 040-based machine out yet?] In my experience, most programs run at

There is an Atari compatible 040 machine out. Yes, it is very expensive.

It is true that the PPC is very very fast. But you miss the whole
point - it is a Mac. Your arguments apply double to cheap 486
machines - why not get one of those instead of an Atari or Amiga?
This has been true for some time now.

>As far as the Pentium goes, the PowerMac still holds the edge - and will
>for some time to come, IMO. A 60Mhz Pentium processor (running
>Pentium-optimized software) is roughly equivalent to a 60Mhz PowerPC
>(running optimized software and *without* a cache card). Add a cache card

>next step being a 66Mhz and then an 80Mhz chip in the top level Mac (and
>all can be equipped with the cache card for added speed).

Herein lies the major problem with this - it is a mac. And this time
i say this not becuase I dislike macs (though I do), but becuase I see
the even larger reality of the huge Intel based software - much larger
than Mac, in fact. Sure the PowerPC has an emulator, but it costs
almost as much as a cheap 486 alone, and it is slower than a fast 486
machine.

>
>Second, software compatability. I know of *absolutely* no software that

Well, that's good to know - I was wondering how compatible it would be.

>
>And finally, there's overall support. How many people (here in the USA)
>have a store which has shelves upon shelves of Atari hardware and software
>within, say, a five mile radius? And how many have similar stores for
>Apple? Within a five mile radius from my house, there's exactly ONE place
>that charges an arm and a leg for everything. Within that same radius,
>there's at least half a dozen Apple stores. Now please cut the bullshit
>that Apple is trying to "save" the Macintosh.

But they are - for the long term. The real problem is that very soon,
a number of very good OS choices are going to appear - there's OS/2,
taligent (PINK), Chicago, or even nextstep. All of these throw off
the vestages of MSDOS, and are pretty decent OS's.

The real problem is, that apple does not play well with others. They
are so used to being locked in the ivory tower of macness that they
will not get along well with all of the new OS choices, and they may
very well be swallowed up.

Also, as a side point, is not Taligents venture underwritten in part
by Apple? What will all the PowerPC mac users do in a few years if
apple switches to this new OS?

>
>If anyone has anything *intelligent* to say, please do so in my mailbox.

Yeah, all 12 mac software packages... each about $600, right?

>
>How much Pentium recompiled software is there out there? Almost NONE.
>
>I will bet you a dollar that in 6 months, more major applications will
>be PowerPC native than re-compiled for the Pentium.

You fail to understand... if a Pentium is in a machine, the speedup
will be vast even if not specifically recompiled for that machine.

But on the Mac - if you don't recompile, you've got to go through the
Emulator. There goes the speed...

I read somewhere that trading for CBM stock has been suspended on WS
until they either reorganize or...

Good Luck CBM!

Well, perhaps they'll reorganize... I find it hard to believe that
they will be able to find no investors with a fairly successful CD-32
on board.

Perhaps they were selling the CD-32 too cheaply?

Careful with that double-edged sword... oops! You've just sliced
yourself clean open.

The main reason why most of the CD-32 titles look bleak to say the
least is becuase they are ports. What I was mainly talking about are
titles that really take advantage of the CD-32 (like microcosm).
There are (I think) more of these titles that there are Jaguar
titles.

But there are over 80 Jaguar devs signed up now... more not less.
Also, rumors abound that MKIII will use the Jaguar chipset (perhaps
you've headr that acclaims contract was dropped). All this combined
with a very warm Jaguar reception from the game magazines, and actual
for-real Jaguar ads on cable mean a good time ahead for Atari.

You make a mistake by saying anything about the 3dO - that is an
entriley different matter, and will sink or swim regardless of what
Atari does. Anyone who is able to spend $400 to $500 at once on a
game machine will be able to spend another $200...

I am not for CBM going under at all. I am just giving logical reasons
for the Jaguar's success.

I would howveer say that the stock price does matter - if the stock
price does not go up, that means something is wrong - as we now can
all see. If CBM DOES go under, how happy do you think you'll be
playing old A1200 games in a year after only three developers are
left? I looked pretty hard at all of the facts before I bought my
Jaguar, and that's also why I have yet to buy a 3DO.

Nope, all I've heard is an additional 110,000 units shipped (not
sold). However, the good news is that it appears Atari has begun
placing TV ads in quite a few cities on cable - MTV, and programs like
that.

The only thing that annoys me is the painfully slow release of
software. At least most of it is really good!

Atari is in little danger of folding right now - the stock price just
went up another $1 to about $8 now, and Time-Warner just purchased
another 1.5 million shares. Hardly sounds like a company on the brink
of disaster!

I think CBM will probably pull out of it - my guess is that it is some
crafty CBM plot to put all other companies off their gaurd - probably
next week they release the PowerPC AAAAA A32K! :-)

Seriously, though, I do home CBM pulls out of it OK...

>

I don't "expect" anybody to do anything... Of course time will tell.

I agree with the wait and see attitude. But Apple has had no trouble selling these things yet. The software will come for one reason, Apple has commited to getting 90% of their systems onto RISC in two years. And Apple sold almost 4 million machines last year, that a lot of potential buyers. Even if only current Mac software companies move over, it will be enough.

Microsoft and others make lots of money on Mac software, they know there will be a large demand for such software. They will produce it. Most exisiting Mac software gets away with a re-compile. This is not expensive, but has a large potential payoff. The first native program in any catagory has an advantage.

I don't expect PowerMac to make inroads into Intel for a while. If Apple can get it's product line smoothly moved over, within two years they will have a very large catalog of native software.

But a first time buyer, who can buy a PowerMac which is cheaper and faster than a Pentium may be swayed. Remember, RISC natives run at full speed, but there has been almost ZERO re-compiles for Pentium.

This is because the Intel world is in disarray. Do they go Pentium, M1, an AMD variation, or that new Pentium clone which was talked about last week? Each requires different compiles. So the venders are waiting until that settles. They will, for now, ship only current binaries. This makes quickly coming RISC natives look even faster!

Please don't confuse my liking RISC and PowerPC in particular with total Apple support. I happen to like Mac, but am realistic to know that it has an uphill fight. I do however see PowerPC has a great

boon for those who use it. It's fast, cheap, and increasing in power at an excellent rate. I don't see Intel doing that.

Like I aways say, Pentium was late, hot, slow, and expensive. PowerPC was on time, cool, fast, and cheap.

Time and the free market will decide the rest! :-)

They arn't making a frontal assault on the PC market. They will keep almost 100% of the Mac people, get many new people and might sway a small amount of current PC people.

> PC buyers tend to be better informed than Mac buyers. They will see
> that the can get about the same specinf/specfp for slighly less with a

PC buyers better informed? Where did that come from? Are Mac owners stupid? Do owning PC's convey integlligence? You generalize too much.

And yes, if I had a large PC library, and could not afford to upgrade I would stick with a PC. I'd be a fool otherwise. But there are MILLIONS of people who have PC's that are slower than PPC's emulation, or don't own a PC, or are willing to buy new software for enough of a speed up.

> What a concept for a `next generation` chip, eh? The chances of PC
> software houses rushing to produce Power PC/Mac versions of their existing
> software is about the same as them rushing it out on OS/2!!!!

True. The point? Microsoft make tons of money in Macs. Most software is availble on both platforms. Too keep their market, the Mac software people will quickly be forced to move over. Almost every large PC vender has a Mac arm also. Microsoft, Wordperfect, Novell, Symantec, Lotus, etc, etc.

>
> Care to place a bet on which platfrom will STILL be dominant in a
> year? I doubt that Power Mac will have much of an effect on overall apple
> market share.

Of course Intel machines will dominate. I've never said otherwise. I think that they will feel a lot of pressure though.

Apple shipped more computers than anyone last year. Their
market share has improved in the last two years.

They have had improving sales every year when more expensive
than PC's, without the ability to emulate, and medium speed running
their own software.

Why won't things improve, when they are cheaper than similar PC's,
with an okay emulation, and super speed running their own software?

These things subtract nothing, add a lot, and will sway customers.

They have nothing to lose, and everything to gain.

Again, time and the free market will decide...

Where do you get a $2,900 price? Please don't compare Apple list price quoted in a magazine to mail order PC prices. Apple street prices are much lower. Articles generally quote the companys offical price, not actualy what people pay for it.

A complete PowerMac 6100 with

1) 60Mhz PowerPC601 (32K L1 cache, FPU, etc)
2) 8 Meg RAM (64 bit path to memory)
3) 160M Harddrive
4) ethernet
5) 16 bit video
6) 16 bit stereo sound in and out
7) Floppy drive
8) SCSI
9) 2 serial ports.
10) 14" monitor
11) Keyboard

Can be bought for between $2,000 and $2,300. I've odles of ads from stores which have them at these prices.

The base machine with everything except monitor and keyboard can also be store bought at CompUSA or Fry's, etc, for about $1,600.

This is only two weeks after they came out, expect the prices to drop.

Pentiums have been out for almost a year and still are too expensive.

: Stefan is an idiot, just look at his posts.

Of course, what would Stefan know. Mr Troedsson, using his telepathy and third vision can see clearly that Team 17 have Jaguar development units stacked to the rafters. In fact, the reason why there's been a lack of Jaguars available in the US and Europe is that Team 17 have bought millions of them.

Sheesh.

Pot.
Kettle.
Black.

If we had a stupidity contest, I think you would come out a long way ahead.

Correction: The Falcon has been out for over two years. Falcon sales are in
the range of 35,000. I suggest Atari lowers the price and sales could double
with in a three month period if that many units were available.

>3DO amazingly great.
>

WOW. So 3DO is temporarily paying for your living, huh?

I bet Commodore's former engineers will have quite some resume by the
end of the year... :(

Not many people will pay $499.99 for a game system, just like not many
people paid $699.99 for it. A major financial backer of 3DO just decided
to pour 12.8 million dollars into 3DO's main competition--Atari Corp.
Even though Trip Hawkins will never admit to Atari being 3DO's main
competition.

MY PREDICTION: 3DO is going to lay-off a hundred employees by the end
of the year due to the fact that they must lower the amount they charge
companies for the use of their technology.

QUESTION: What happened to AT&T's machine and all of the other companies
that promised to use the 3DO technology? "Ah, we'll wait on it" haha.

> (And yes, some of us have Amigas on our desks.)
They collecting discontinued products? Who knows, they might have one
added to their desk soon enough. :)

yes..infact if this newsgroup is to be created as a comp.sys.atari.announce
which should incorporate all atari computer hardware, 8,16,32 bit hard and
software developments as much support as possible is needed.

It requires at least +100 votes to create this group and no more than
1/3 of votes against it. All the votes will be posted, (the people who
voted against and the people who voted for the group) once the actual
idea has passed and it is deemed worthy to vote for this group (for possible
creation).

Cheers

Actually, you can now buy a Quadra 605 (68LC040 @ 25Mhz) w/8-MB RAM, a
120-MB hard drive, keyboard, mouse, StyleWriter II printer, System 7.1 and
ClarisWorks 2.0 (2.1?) for less than $900. Tack on another $200 for a
starter monitor (640x480, decent quality) and off you go - or you can hook
up a PC-type monitor for even less $$$.

You will buy in in July of 1994? <grin>

The Falcon is a fine machine, with many inovative features, but I would
not want to brag about sales of 35,000. That is about 4 days of sales
of IBM or Apple corperation. Perhaps 5 days of Compaq sales.

There are _zero_ PRep machines out today. IBM and Apple are still working PReP out. Avid Mac people are amongst the biggest buyers they need a computer _today_ not at the end of the year.

Plenty of people bought Macs without being PC compatible. Do you thing the average buyer will care about PReP? Many people will, but not a large percentage of the potential market.

IBM and Apple are each pushing for things they want the other doesn't. I hope they come together, as I would rather own a PReP machine. With the level of hardware abstraction, there is no real reason for Apple not to ship a PReP machine when the standard is actually released. This assume no political stupidity at Apple.

> Incompatible - sux.
>

And the Falcon is compatible with.?.?.?.

BTW this is not a Falcon slam, I think it's a pretty hot machine, but those in "compatibility" glass houses should not throw stones.

This is so difficult to understand. I've been using IBM's for years now, but Atari is hundred times more confusing. I want to get files that I've downloaded with my 386sx to an atari 1050 disk (800XL.) The programs are all "term" programs so there is no way I can download them from my computer using phone lines. So then, I downloaded programs like UTIL and MULE, I don't understand MULE and UTIL only works with MYDOS disks. So now, I've gone and downloaded MYDOS but, it doesn't seem to have been compiled yet. So can someone please help me get the programs on my IBM disk to my ATARI disk with the correct DOS.

I would like for these programs to just pop on the Atari screen when I boot-up. How do I do this? Any help would be appreciated.

If I was in the position of having 600 quid or wahtever to spend wisely on a 3DO
then I might pay attention, but seeing as how I could buy a JAg and about 10
games for that I think I'd have to disagree...

AC> There are _zero_ PRep machines out today. IBM and Apple are still working
AC> PReP out. Avid Mac people are amongst the biggest buyers they need
AC> a computer _today_ not at the end of the year.

According to the PowerPC FAQ, IBM's systems ARE PReP compatible, the current PowerMACs are NOT .... That's my source.

(True, PReP is out in Alpha documentation only, but that's a lot better than nothing)

AC> Plenty of people bought Macs without being PC compatible. Do you thing
AC> the average buyer will care about PReP? Many people will, but not a large
AC> percentage of the potential market.

Bah! Ofcourse the average buyer will care about PReP! The whole idea behind PowerPC and PReP is to *STOP* incompatibilities among computers! All users should be able to run ALL OS's, no matter who built the computer!
(And use all sorts of hardware peripherals)

AC> IBM and Apple are each pushing for things they want the other doesn't.
AC> I hope they come together, as I would rather own a PReP machine. With
AC> the level of hardware abstraction, there is no real reason for
AC> Apple not to ship a PReP machine when the standard is actually released.
AC> This assume no political stupidity at Apple.

But the current PowerMACs aren't anywhere NEAR PReP .. they will be TOTALLY incompatible both soft and hard-wise then they start shipping PReP machines! IBM's PowerPC:s are atleast compatible with the alpha version of PReP.

AC> > Incompatible - sux.
AC>
AC> And the Falcon is compatible with.?.?.?.

All TOS compatible programs, and most of the hardware-bashing ST/STe applications. Did you think it was supposed to be compatible with anything else?

AC> BTW this is not a Falcon slam, I think it's a pretty hot machine, but
AC> those in "compatibility" glass houses should not throw stones.

...you seem to have missed the whole point with the "PowerPC" ..

(Jerry Lineberry wants to get started on his Atari 8-bit from a IBM.)
Util only works on MyDOS disks. True, but you can format a MyDOS disk
on your IBM using UTIL, then put the stuff you want on the disk, then
go over to your Atari and read it. IF you have a boot disk for your
Atari that will read the MyDOS disk you write with your IBM. If you
don't have a boot disk that will allow reading the MyDOS disk, hmmmm...,
I guess you'll have to purchase one from CSS or FTe. See vendor
list.

I never was arguing that the Macs had better sound than the Atari. The avs
and Power Macs have 16-bit sound. All the other current macs have 8-bit stereo.
There are man more avs and Power Macs out there than there are Falcons.
Whether or not the Falcon had 16-bit sound before the Mac is irrelevant, since
there are so few of them. (Even in comparison to the ST user base, which is
still predominantly ST/(Mega) ST(e)/TT.)

Even if Falcons were more numerous than Macs with 16-bit sound, it still would
not make a difference, since your point was that Falcons had 16-bit sound.
The fact that Falcons have 16-bit sound is not affected in any way by the fact
that they had it earlier than the avs did.

Having used both AtariWorks and Mac word processors, I can assure you that
feature-for-feature, this is not so. Before you flame me, also consider the
fact that I have owned Ataris for ten years.

>DOn't go spouting "feature wars" because that's not what I'm going at. I'm

I don't care what you use. I just get tired of people with Ataris telling
me that Macs suck, and bragging about how they think their 16MHz 68000 or their
16MHz 68030 is as fast as a 486DX2/66.

Peter, why do you insist on citing sales figures for every single
argument?! It is so annoying! If you don't have anything constructive
to add than don't post. As your sig says, "It's that simple."
For example....
If someone claims that, "The Falcon030 has 16-bit stereo sound."
an unacceptable argument is:
"Well, Apple sold x Quadras!"
It has nothing to do with the Falcon's sound. If Apple released a
computer that did not sell well would you tell all your Mac cronies
to stop advocating it because it was unsupported?!

Having used AtariWorks and Microsoft Worm on macs and PC's, I'd have
to say that I prefer AW - if nothing else, for the vastly superior
spell checker (superior especially in interface). It all really falls
to opinion - 'ol MW may have a lot more features, but there are very
few I'd actually use.

Besides, all real work calls for no less than LaTex. In terms of raw
features, it makes MW look like an old wooden shoehorn.

>16MHz 68030 is as fast as a 486DX2/66.

I'm not claiming that my Falcon runs anywhere near as fast as a 486/66
(except perhaps screen display and music and... well, never mind!).
But I do get tired of being constantly told that Mac is the only
choice. Or IBM. Or whatever.

In the immortal words of Rodney king - "Can't we all just get along?" :-)

>he bought 3dO? In a box!

TE does look nice... as do a few of the other games. I personally
think C&B looks nice, but I don't like that kind of game. But - I also
quite like some of the games for the Jaguar, and for two player action
games the Jaguar is still ahead (Raiden & Tempest). The Jag is rather
slim on number of games though... which does not look to improve in
the very near future. On the other hand, the games that are coming
out are really good!

>

>wisely, and not be blocked from getting cool stuff by some ridiculous pro-
>Atari prejudice, that's my $.02..

The problem is, that's your $500.02 (don't forget tax - or
shipping!). I see the Jaguar having a much broader market than the
3DO in just a few months. At $500, the 3DO is still beyong the magic
price point that makes sales over a few hundred thousand possible in
any resonable length of time. Only Sega may possibly escape this
price event horizon, and then only by burning advertising money to
reach escape velocity...

If only 3DO would work on the multi-player games, and advertise they
would be a huge success. If only ANYONE would really go into large
scale multiplayer games, it would be a huge success. Yes, I know of
the "plans" for Air Warrior for 3DO. Where, or really, When, is it?

>I won't disagree about the price though :-)

I used to be an avid Atari user, until I woke up and realized that Atari couldn't care less about the US market.

About eight months ago I was seriously considering replacing my aged 1040STf for a Falcon. I wandered over to the nearest Atari store (over an hour away!) and took a look at it. Yeah, it was a nice machine. Yeah, I was mildly impressed. Then I asked what the price was. SHEESH! $1100 for a barely-supported machine with an anemic 68030 CPU (what is it, 16Mhz? 25?) and an 80-MB hard drive. At that time, I could have bought a 33Mhz 68030 Macintosh *and* a monitor and brought home change! Today, I can buy a 25Mhz 68040-based Macintosh with keyboard *and* mouse *and* monitor *and* an excellent inkjet printer - and STILL bring home change!

So much for "Power Without The Price", huh?

AtariWorks is eaier to use and works better for my word processing needs.
I don't know what you were referring to by the "feature for feature" line -
sounds like a computer ad. I don't care if Microsoft word can do xyz billions
of things, I don't use a word processor for that, and frankly don't need it.
On the Mac I used MacWrite because it was the best choice for me. I don't
like ANY microsoft product (I unfortunately have to tolerate their presence on
my 486 laptop. pthbt)

>I don't care what you use. I just get tired of people with Ataris telling

Well, I'm tired of Mac people with this haughty "we're superior to you"
attitude in terms of GUI friendlyness. In my book, Atari wins hands down.
And yes, the OS (desktop) part of the computer is very important to me, since
it is the application I DO use most.

I think the 3d0 is a fairly nice machine, and if it was cheaper I may have bought one. However, I bought an Atari Jaguar and am quite happy with it. I wouldn't compare too many of the Jags games with 3do games. But if you are looking to do that, then be fair about it. Compare first gen. to first gen. It's easy to see that the Jaguar has come out with better quality first generation games.

David,
You stated that the time when the Falcon came out bears no relevance on its sound quality. Yet, you bring up the argument that Apple has sold much more Macs than Atari has Falcons. My question is: what kind of reasoning is that?!!!! What does sales figures have to do with sound quailty?!

Lord T.,
Yes, you can buy a comparable Mac for less than a Falcon. However, does that 68030 33Mhz mac perform better than a Falcon. In my experience, no, it doesn't. My stock Falcon keeps up very well with a 68030 25Mhz LCIII w/ FPU. Also, do you want to be limited to an 80 meg hard drive and 4 megs of RAM on a Mac? Since Atari software doesn't need as much horsepower the Falcon runs very well on its 16Mhz 68030. It also doesn't have to contend with System 7.

I'm sure that I could argue with you at length about the friendliness of the
Atari GUI, but I'm sure you realise that it's not only the design of the GUI
which makes a computer friendly, but also the consistency of the programs
using the GUI. In this regard, you cannot disagree that Atari programs are
more inconsistent than Mac programs. There is nothing really inherently
inferior with GEM; its problem is that not enough programs follow Atari's
interface guidelines.

Unfortunately, MultiTOS has changed this. I honestly think Atari doesn't
know where they're going with it. It's part Mac, part DOS, part Unix, and
it doesn't do any of them very well. For GEM multi-tasking, Geneva is far
superior.

No relevance whatsoever. That's my point -- someone said, "Don't talk to
Atari owners about 16-bit sound, they had it before the Mac." and the reply
to that was "Well, so what -- there are more Macs with 16-bit sound than
Falcons." The point is that if you consider time of release as relevant,
you should also consider sales figures -- presumably both will have an
impact on the support available for the feature. Do they affect the sound
quality though? No, not at all.

The Falcon is dead! It was a good machine. But, Atari has abandoned their computer line and new software is almost non existent. So why would a new user consider an orphan? The Macs are cheap with plentiful of inexpensive software. Mac Performas are shipped with ClarisWorks and many other titles. CompUSA is now including ClarisWorks for the $899 040 Quadra 605 FREE!!!!

Certainly. Head on over to CompUSA. The entire system (excluding monitor)
costs $1150, then CompUSA gives you a $150 rebate on the spot, and Apple
hands you another $150 rebate when you mail in the included coupon. Total
cost: About $850. The CompUSA on Route 1 in Edison (?), NJ has this deal,
and the CompUSA in Mount Laurel (?), NJ does too so I don't think it's
just a one-store deal. I saw this price about two weeks ago.

Quit making excuses for the slowness of your Falcon! Can your Falcon keep up with the $899 Quadra 605 with 80 megs. How about the $1100 Q605 with eight megs and 160 meg HD? The Mac also doesn't have to contend with the Atari OS and their screwed up management!

Ooh, so mature you are. My estimation of you dropped a few points there. I
was trying to avoid a shouting match since it would get us nowhere, let me
try this: YOU SAID EXACTLY THAT YOU IDIOT! There, happy now?

>>AtariWorks is eaier to use and works better for my word processing needs.

>Honestly -- no flames intended here -- you should really try Clarisworks.
>I haven't seen any integrated program better than it on *any* platform.

Okay, I'll give it the benefit because I _do_ like Claris stuff. Still, AW
does enough for me, and because of the inherent differences in the OS and
GUI, _ANY_ Atari based software works better for me than _ANY_ Mac software.
That's the point I was getting at. There are simply too many screwed up
things about the Mac OS such that I will NEVER own or use any Macintosh
computer.

>I'm sure that I could argue with you at length about the friendliness of the
>Atari GUI, but I'm sure you realise that it's not only the design of the GUI
>which makes a computer friendly, but also the consistency of the programs
>using the GUI. In this regard, you cannot disagree that Atari programs are
>more inconsistent than Mac programs. There is nothing really inherently
>inferior with GEM; its problem is that not enough programs follow Atari's
>interface guidelines.

OKay, the past has been more inconsistent, but I like the standard better, and
(by this I mean the Atari std. vs the Mac std.)
new software wil only verge towards that new better (imo of course) standard.
Therefore, it is best for me to stay with Atari. (oh no, not logic...)

>Unfortunately, MultiTOS has changed this. I honestly think Atari doesn't
>know where they're going with it. It's part Mac, part DOS, part Unix, and
>it doesn't do any of them very well. For GEM multi-tasking, Geneva is far
>superior.

Part DOS = Old TOS Stuff, Part Unix = MiNT Stuff, Part Mac = ???
doesn't do any of them well = your opinion. I think MTOS works fine. A
bit slowly, but getting NVDI will cure that.
I haven't tried Geneva, and though I trust Gribnif to make quality software,
I am not willing to go with cooperative MultiTasking stuff and I support the
work Atari is doing with MTOS and am an advocate in that direction.

Huh, apples says "first home computer with a DSP and 16 bit sounds".
The Next came out with a DSP a long, long time ago. The Falcon was out
before the first mac with inbuilt DSP. There have been DSP as optional
extras for Amigas a long time before the Falcon was introduced. Unless
Apple said "first home computer with DSP and 16 bit sound made by Apple",
their claim is an outright lie.

The point is that 16 bit sound is the standard for all future Atari Machines.
How much is out there that really uses the advantages of the AV Macs? For
D2D stuff, you still need to get a extra board. The Falcon is a nice unit
with DSP and costs less than the AV Macs as an entry point into DSP/16 bit
sound level computing.

This is the first time that I've felt the need to respond to a post. I find it VERY hard to believe that a 16mhz 030 w/ dsp tied to a 16bit data bus can outperform a 33mhz or even a 25mhz 030 w/ 882. In no way do I doubt the fact that Atari's software is "tighter", but I don't think that its written well enough to over come processors with twice the power and a data bus that doesn't bottleneck the processor.
Secondly, your not limited to 4 / 80. Though I only have one simm slot in my LCIII it can take simms up to 32megs and there are third party extensions which allow for more than one simm to be installed. As for the HD, the largest I've seen that can fit under the hood is over 300megs. If you want bigger, get an external one. (La Cie has gig drives that fit into a TINY case that is very durable for transportaion. And adding the drive is simple, just plug it into the scsi, format, and go. Plus, I can use VGA moniters with it as well, which both me and my wallet prefer over Trinitrons. The 16bit graphics are nice, and so is the 8bit sound. I'm sure the Atari has way better sound, but for the most part I rarely take advantage of it, and when I do, I don't think the difference between 8 bit and 16 bit will be so noticible that I will not enjoy using the program. Anyway, most games anyway, where the sound is important, are on CDROM now with 44.1khz coming straight off the CD through the audio out on the drive.
This is not a flame, I just wanted to express my opinion and correct what I feel to be unfounded comments.
Besides, you could count my age on one hand when I got my first Atari800 and I tried to stick with them through the begining of the st line...but that was back when atari was competing with the mac plus or se and the amiga 500. Unfortunately, it seemed that atari was content to keep competing with those machines long after their companies released newer models.

Pete, was I making excuses for my Falcon being slow? No, I wasn't.
I was pointing out that despite the fact that it has a 68030 it
runs at a very decent speed. Of course people like yourself
blindly think, "Gosh, it has a higher clock speed so it MUST be
faster." If this is the truth than why can an 8Mhz ST keep up
with many 386s? The Falcon, in my experience, runs right up there
with an LCIII with FPU. Do you want to argue this? Mind you
I do not have a math coprocessor in the Falcon. Yet it keeps
up with the LCIII which has a higher clock rate 68030. Why is
this, Pete? I can't believe that you'd flame the Atari OS! It
is very System 7-like with hardly any of the system heap. My
friend kept running upwards of 3 megs of system heap with System
7. (Yes, I know you can thin that down).
I'll say this right now, Pete.... the Falcon is a quick machine!
The desktop is much more usable than Windows on my roomate's
486DX-33. TOS 4.04 is much more pleasant to use than System 7
on any system, IMO.

Of course the Falcon is slightly cheaper than the Q660AV. However there is
only about a $300 difference in price. For the extra $300 - 040, more memory
and HD space, video ports for VCR and TV and so on.

Yeah, they just fire their management. I mean, who cares if the guy
founded the company? The board of directors wanted him out (for some
unknown reason - political, most likely), so Mr. Scully gets the
old heave ho!

And gee, Peter, you forgot to mention that there have been more
Macs sold than Falcons - your ever persistent reason why Macs
are superior to all.

The Jaguar seems to be doing almost ok. ATARI has solved
some of their previous biggest problems like no advertising,
no software companies behind it (finally they got quite
a few decent ones) and such.

The last problem with the Jaguar is.... SUPPLIES! For
some unknown reasons (I'm trying to find out why), the
Jaguar is not being manufactured in the amount of units
it should... and it is costing ATARI because there's
demand for it... I went to three stores and the three
of them where out of stock, waiting for quite a time for
more supplies to come....

I am personally waiting for ATARI to fix this, DOOM
on the Jaguar, and then check if I got the money to buy one ;-)

Hmmm...

Guess that gives a new meaning to the phrase "hamm mode on the Amiga".

And now the obvious question: Do they cook things faster with fast-RAM installed?

Damn, now we won't know what people mean when they say thier Amiga is Toaster equiped...

Um, change your SIG. That doesn't hold water any more. When Atari can come out with an 040-based computer for under $900, *then* Atari will have Power Without the Price.

>on its 16Mhz 68030. It also doesn't have to contend with System 7.

First, let's get something straight. There's no such thing as an Atari that's "comparable" to a Mac (and I *know* I'm going to get dozens of "oh yeah?!?" letters on that point). Atari, in the USA, simply lacks the money, expertise, userbase, distribution channels and overall support that the Mac has. With precious few exceptions, the top-of-the-line software in a given category on the Mac is far superior to the top-of-the-line package on the Atari. (And please don't accuse me of Atari bashing. This is plain fact, coming from someone with both an Atari ST and a Macintosh.)

And yes, a 33Mhz 030 *does* perform better than a Falcon. It's not simply the machine and the CPU, but also the software that runs on it. Show me, for example, a word processor on the ST that can contend with Microsoft Word. Or a desktop publishing program that can compare with QuarkXPress or PageMaker. Hell, even Atari *magazines* aren't produced on Ataris! MacWorld and MacUser, for example, are about 80% produced on Macs. How many full color, internationally distributed, 250+ page Atari magines are there at are produced on Ataris? There's a reason for that.

And praytell, who says you're "limited" to 80-MB hard drive and 4-MB RAM? The 4-MB limit was broken *years* ago when Apple moved away from the 68000 CPU. The Mac SE, in fact, was the last Mac to have a limit of 4-MB. Hard drive space was NEVER limited (except by your budget and the number of SCSI addresses). My own Mac has 16-MB RAM, an internal 240-MB hard drive, an external 80-MB hard drive, and a 44-MB SyQuest drive.

Atari software doesn't require much horsepower for the simple reason that it doesn't *do* much that requires a lot of horsepower. Run a program that's "comparable" to, say, Adobe Photoshop and tell me how powerful your 16Mhz 68030 is.

And what's wrong with System 7?

Ah c'mon! Stop bickering over stupid things people!

By and large, the MAC has better or at least, more professional software because there is incentive in the market to support the platform.

When the ST line was young and looked promising to many developers it too had its share of innovative and powerful titles.

Remember PC-Ditto? It was a first... GFA BASIC? The Cyber series? Dungeon Master? The list can go on and on...

If the ST market had millions of users, there too would be some siginificant software out (or at least much more of it).

And, don't forget the fact that most early Mac development was done by established software houses who paid dearly for their hardware systems. Thus, there was an additional incentive to control software quality.

The ST was so inexpensive, that for $2,000, a company could buy and entire ST development system and then some. This meant that even college kids and house wives could afford to develop software.

The ST series always had a hardware advantage over the MACS until very recently. Shall I list them? Ok...

1) The ST used the WD 1772 FDC which was faster than the MAC's variable speed disk drive.
2) The ST DMA port could transfer up to a meg a second.
3) ST Video was always color and local bus in nature so it was very fast in graphics manipulation.
4) The ST's internal hardware layout and memory access made it up tp 20% faster than the MACs (until the SE).
5) The ST's always had Midi
6) The ST's mono mode was superior to the MAC's
7) The ST's OS gave the programmer freedom - they could write gui based apps, full-screen games, or text based apps. They weren't locked into one way of writing a program.
8) the ST's were good enough to actual emulate the MACs and run the same software even faster!!!

I don't want to keep flaming everybody but let's just be real and speak the truth...

Ari

Atari does not have to declare the death of the Falcon, the market has! 35,000 units sold in the last two years has not brought a wealth of software. If you read Atari's last press release carefuly, no more new Falcon models are in the pipeline.

In August, a new Mac called the Chameleon will debut that will add new meaning to price/performance. $1500 gets you a 040 at 33 mhz, 250 meg HD, cdrom, monitor, four direct slots and keyboard. Upgradeable to the PowerPC 603. Will have wireless capabilities for Newton and the Powerbooks. Hey why don't I include the article. I have read the original MacWeek article. If this pup comes out as expected, Falcon advocates do not have a leg to stand on by a long shot. It's even true today!

Group: comp.sys.mac.announce, Item 403 (Range: #403 - #404, Unread: 1)
Subject: predictions of new AVs in MacWEEK
From: msh2@cornell.edu (Michael S. Holland), Student Agencies Inc.
Date: 24 Mar 94 19:20:11 -0600

[MacWEEK of 3/21/94 speculates on Apple's plans
for a new, cheap AV based on a 33MHz 68LC040....]

In August a new AV mac is due that is to be priced at under $1500 complete system. That includes CPU, 14" monitor and keyboard, CD 300i, 4/250. If this isn't amazing enough, there is quite a lot that is rumored to be new abou this beast apple is creating. Powered by the 33Mhz 68LC040, it is supposed to be easily (under $500) upgradeable to the PowerPC 603 or 601. It was also reported that it might ship with either 25Mhz or a 40Mhz 040 instead of the 33Mhz.

The real interesting thing about this computer is it's inside, which is quite unlike any mac seen before. It will sport 4 "slots" inside a

chasis that can have multiple front panels (LC,Quatra,PPC,Performa) and multiple feet for tower or desktop models...all in the same main box. The 4 slots will be called "direct connect" slots and will contain such things as a MacTV card (said to be about $200 and come with a remote control), AV card, Communications Slot (for ethernet or modem), and '030 PDS slot. This will also be the first mac to have an infrared receiver on the front for the remote control and later for wireless communication with Newtons and PowerBooks. It will also be the first mac model to have an IDE (integrated drive electronics) hard drive. Common in IBM-PCs this is apparently cheeper than SCSI drives.

So what does this mean and where is Apple going? Sources say the machine is set to replace the Centris/Quatra 610 and allow a very flexible approach to desktop systems. This is being seen by many as the first Mac Clone...made by Apple. Set with such a low price and so many options, it seems Apple is getting ready to cover all users with one easy to make chasis with a wealth of options from it's new AV technology to TV integration. Hopefully, with this kind of expandibility and the power of the PowerPC 601 or 603 behind it, and many board options, we might get beyond the myrid mac models and make buying a mac a simple factor of what you want, and not tradeoffs. Another point broght up else where is that with the possible success of the Houdini 486 PDS card, we might see a faster 66Mhz 486 or P54 pentium card that could be used with this machine to capture more of the fence-sitters in the DOS world.

Lord Thanatos,
Oh yeah?! :-) Your points are well taken but I still don't agree
that the Falcon isn't comparable to any Macs. I have used both
an LCIII and the Falcon and my Falcon easily competes. Even the
owner of the LCIII agrees.
As far as the 4/85 comment that I've been getting crap for.... people
have been posting day after day that they can get a Mac <model>
with 4 megs of RAM and a 80 meg hard drive for $x dollars (x being
less than a Falcon's price). Those were the posts that I was
responding to. My friend is using an LCIII with 8 megs of RAM and
a 160 meg hard drive.
I do not need Photoshop, but I have used it quite a bit on my friend's
machine. Photoshop lists for $895. I merely want to dabble in
photo manipulation (which many other average users want to do) and
am looking into Studio Photo from Compo at $99. Now where did those
savings go from my hardware purchase? They went towards 1 piece of
software!!!! Even if you look at the MS Word list price it is
$495 for Windows (not sure of the Mac price). AtariWorks is $100
(of course it was free with my Falcon). Oh, I am getting the Studio
Photo demo from Compo and will let you know how it compares with
Photoshop (and, no, I don't expect it to have nearly as many features).
Remember STart Magazine? You know, the full color glossy monthly?
Gee, I remember a couple of 100 page issues coming to my house that
were done completely on Atari systems. Imagine that! Current Notes
also uses Ataris (though I know you'll trash it as being amatuer).
Atari Interface Magazine was also produced on Ataris (a stock STe!).
I don't think you'll win many points arguing that Quark is a hell
of a lot better than Calamus SL. Not many people need Quark either.
And, um, what is the price of Quark (yes, Calamus is expensive but
I can choose Pagestream or Calamus 1.09 instead).
What is wrong with System 7 you ask? It is slow (IMO) and takes up
too much memory. I know that you won't agree, but use TOS 4.04
and just maybe you'll see my point. TOS 4.04 is VERY System 7-like
but takes up very little memory. I love it :-)!
BTW, the standard Mac keyboard is hellish and the new mice are also
very difficult to use IMO. Small subjective points, but this is
advocacy :-).

: Microsoft Works is a piece of garbage. It's utter trash; I'm sure nobody
: will disagree with you there. (Microsoft Works is lacking in features, speed,
: and ease-of-use.0 Try WordPerfect 3.0 or ClarisWorks for examples of great
: products. ClarisWorks is *very* nice.

I use MS-Works for DOS and find it to be a pretty good all-in-one
package, especially for someone who has to use it under SoftPC (286
emulator) on a DECstation. HOWEVER, I must profess that I'm researching
Atari alternatives for a number of reasons:

1) I need a true WYSIWYG word processor. MS-Works for DOS is text only
and it's graphics mode is a *joke*.

2) I don't want to be limited to only the fonts supported by my printer.
I can make pretty spectacular documents here at Work, but at home I'm
limited to a couple because of the cheapo 9-pin printer that came with my
DEC (which I can't use since SoftPC won't talk to my 1-and-only serial
port! But that's another matter...)

3) I plan on doing a little amatuer DTP. Packages such as AtariWorks and
Calligrapher 3-Gold can be used for amatuer DTP because of how powerful
they are. I could do it on MS-Works, but again, I'd like to see what I'm
doing.

One more comment: I've used ClarisWorks on my parents Mac and can
agree that it's a VERY nice program (better than MS-Works by a long shot).
My only complaint with it is that it's terribly slow on a 16Mhz 030 over
a 16-bit bus (System 7 is such a drag). MS-Works under emulation sorts
faster than ClarisWorks! Can you figure that?

[I think I should have donned flame-proof armor before posting to
an *.advocacy group. Oh, well...]

Sure it is, when you take *everything* into consideration. (BTW, how do
you connect a StyleWriter II to your PC?) Such as, for example, ease of
setup and installation which the PC has never, and will never, surpass.
Same thing for upgradability. Is your 486 Pentium ready? Probably not. The
Q-605 is PowerPC ready.

"Tripple"? Try "triple". If you don't recognize them, well, that's your fault. Maybe you should head over to an Apple computer store one day, like CompUSA, and read some of the price tags. Assuming, of course, you can recognize price tags.

If you're attempting to be witty and claim that Mac prices are three times what is quoted above, the joke is on you. Those above-listed prices are pretty accurate, though I've seen 8/160 Q-605's going for about $50-$100 less.

Anybody who claims you can get a PowerMac cheaper than a 486DX66 is
a liar.

Anybody who claims a 486DX66 is near a fast as a PowerMac 6100 is
a liar.

That's no better than asking why a Pentium is more expensive than
a 486DX66, it's faster. Likewise the PowerMac is faster also.

< Note about pentiums being out a year deleted >

> A year? Hmmm, I've only seen them available mail order for a few months. I
> expect the price to drop quickly by the end of the summer. Well under what
> they are going for now.
>

That's 66Mhz Pentiums only over the last few months. Pentiums have been
out almost year, but at 60Mhz for the first few months.

And after almost a year, a 60Mhz Pentium machine is _still_ more
expensive than a 60Mhz PowerPC of similar power.

Pentiums are excellent chips, but Intel gets too much for them!
Intel charges more for the slowest Pentium than Moto does for the
fastest PowerPC. That is probably why Pentium machines cost
more. The chip costs $350 more, for not any faster!

Yes, but all of this high-end software that is above anything the
Atari offers (though there is not so much as so might think) - costs a
LOT of money, so much that the only way an individual will be able to
use it is to pirate it. Down in the affordable range, Atari and Mac
have many similary featured products.

>
>And yes, a 33Mhz 030 *does* perform better than a Falcon. It's not simply

>there at are produced on Ataris? There's a reason for that.

Poor example - AW, or just about any new Atari WP is much better than
MW. And calamus can easily take on Quark X-press.... with Pagestream
being able to do almost anything you would want to do for even less.

The reason Atari computers don't have 250+ page magazines in full
color is not that the Atari software lacks - it's that the user base
is not large enough to support such magazines.

<some stuff deleted>

I have an LCIII, and it does NOT have stereo sound. Rather, it sends
the mono signal to two channels. People may be confused because the
books that come with the computer indicate that it has a stereo output
plug.
I hope this resovels this issue.

If there were any professional-level software out there for the Falcon, and If Atari gave a damn about the US market (they don't), and If there were more than ~300,000 Falcons around, then *maybe* the Falcon could reasonably compete. They can't, period. The biggest testament I can give you is the fact that there are half a dozen Mac-supporting stores and about ten PC-supporting stores within a 20 minute radius of me. The nearest Atari store is fifteen minutes away, if you don't mind buying used and water-damaged equipment. After that, it's an hour and a half drive. Maybe you're different, but I *enjoy* a computer with a huge userbase and lots of support. You just can't get that on the Atari.

>As far as the 4/85 comment that I've been getting crap for.... people

Quadra 605, 8-MB RAM, 80-MB (or 120-MB, depending on where you shop) hard drive, keyboard, mouse, StyleWriter II, and ClarisWorks for $850. FYI.

>I do not need Photoshop, but I have used it quite a bit on my friend's

>(of course it was free with my Falcon). Oh, I am getting the Studio
>Photo demo from Compo and will let you know how it compares with
>Photoshop (and, no, I don't expect it to have nearly as many features).

If you don't need Photoshop, then don't use it. Photoshop is a professional-level tool; there exists *nothing* comparable to it on the Atari. (Photoshop *lists* for $895, but it sells for about $300 less. When was the last time you bought software at list price?) If, however, you don't need the power of Photoshop but still want to work with image manipulation, there's about a half dozen very good programs on the Mac ranging from shareware (!!!) to $300 packages.
MS Word is $295; again, when do you buy software at list price?

Furthermore, there are at least half a dozen other word processors on the Mac. While Word is my personal preference (because it can read virtually any other WP's files), there are alternatives. WriteNow, for example, is a $40 word processor that, in my estimation, 80% of the word processing community can use in place of top-sellers like Word.

>Remember STart Magazine? You know, the full color glossy monthly?

Vaguely. Is that mag still around?

>Gee, I remember a couple of 100 page issues coming to my house that
>were done completely on Atari systems. Imagine that! Current Notes
>also uses Ataris (though I know you'll trash it as being amatuer).

Partially correct. It IS an amateur magazine, but I won't trash it BECAUSE it's amateur. STart was (is?) a good mag; the issues I saw (when STart first came out) were not done on Ataris, though.

>Atari Interface Magazine was also produced on Ataris (a stock STe!).

Never saw it. Never, in fact, heard of it.

>I don't think you'll win many points arguing that Quark is a hell
>of a lot better than Calamus SL. Not many people need Quark either.
>And, um, what is the price of Quark (yes, Calamus is expensive but
>I can choose Pagestream or Calamus 1.09 instead).

Have you ever USED XPress in a professional environment? Tell me, if Calamus is at least the equal of XPress, then why isn't it a top seller? Why don't companies switch to Ataris and Calamus? True, not many "regular" (read: non-professional) people need XPress, but (again) there's less expensive, very powerful alternatives. XPress is $590, a bargain considering what it can do. PageMaker is $10 cheaper. Ready Set Go is $220 and is impressively feature-rich.

>What is wrong with System 7 you ask? It is slow (IMO) and takes up
>too much memory. I know that you won't agree, but use TOS 4.04
>and just maybe you'll see my point. TOS 4.04 is VERY System 7-like
>but takes up very little memory. I love it :-)!

System 7 is, in reality, no slower than any other System. In fact, several Macs (any with an 030) run *faster* under System 7 than under earlier Systems. The memory issue I'll concur with, though; a basic System 7 installation eats up about 1.7-MB RAM. For what System 7 *gives you*, however, it's pretty worth it. I've never used TOS 4.04, but does it have all of System 7's features? Built-in file sharing (connecting a single cable to two computers and clicking a few buttons)? Support for multiple languages? Drag and drop ease of use? Virtual memory? The scores of other features?
Besides, you're comparing apples and oranges (no pun intended), really. TOS is a ROM-based operating system, is it not? Of COURSE it won't take up lots of RAM if it's ROM-based. That's a plus, sure, but how about upgradability? It's a hell of a lot easier (and not warranty-threatening)

to install a software-based OS than it is to swap ROMs.

>BTW, the standard Mac keyboard is hellish and the new mice are also
>very difficult to use IMO. Small subjective points, but this is
>advocacy :-).

The new mice are OUTSTANDING. I've switched to one; it's on the right of my keyboard, in fact. I've also had no problems using the standard Mac keyboard; however, most users opt for an extended keyboard, which is ~$20-$60 more than the standard one, depending on which model you buy.

>CompUSA, and read some of the price tags. Assuming, of course, you can
>recognize price tags.

Hmm - they may be the prices you're used to paying. Over here in the
UK, I think not. I've just been into the newsagents and opened
MacWorld. Lookup the 1st advert, and see a quadra AV going for (drum
roll) the princely sum of 1665+VAT. This is UK pounds. Therefore, the
Q660 (I think it was 660, it WAS a 600 number), is approx 2000. I
believe this was 4/80 (may have been 8/80). A 4/80 Falcon +CDrom is
approx 1000 (850+150). So we have 1000 to spend on a CPU upgrade, and
maybe a mem upgrade. Wow, that'll be difficult...

Possibly in your part of the world it is a different story; if so then
I think you ought to qualify your post . The preaching attitude really
gets up my nose, when the facts are plain wrong. It's also bad form
to correct anothers' spelling on the net.

Later,
Simon.

Source record: 17624

The closest Macintosh store that I have is a 45 minute drive from
my home. Sure, this isn't usually the case, but it is my situation.
That is a good price on the Quadra. My campus Mac dealer is selling
the LCIII 4/160 for $950. Mind you, this is an educational reseller
who can only make 6% profit on Apple products from what I've heard.
Is the Quadra from a mailorder house? You can be sure that I can't
get that deal around where I live.
Supposedly Retouche Pro is in Photoshop's performance range. It
costs around $800 so I guess it should be. From what I hear this
product is comparable. Retouche, Studio Photo, True Paint.... what
else do you want? Never mind that Chagall should be released soon
or has been released.
Claiming that if Calamus SL is the best than everyone would be using
it is just a silly argument. Do you really think that Windows is
the best operating system. You don't do you? Well, how come people
use clones over Macs? Do you really think that clones are better
machines? Its advertising! It has nothing to do with how capable
Atari's machines are, but how capable Atari's marketing is.
I don't need file sharing, but I believe that you are right- the
Atari doesn't have it. I've heard that it will be in the new TOS
(version 5), but I don't know. TOS 4 does have drag 'n' drop,
icons can be changed and placed on the desktop, every menu command
is configurable, programs can be launched via a function key. I
think that it compares very favorably with System 7. I think when
Neodesk 4 comes out it will blow System 7 away (and TOS). Neodesk
3 already offers incredibly nice features (split windows, mix icons
and text). Add Geneva to the mix and you get fast cooperative
multitasking and tear-down windows among other nice goodies.
I still contend that the new mouse is horrible. My friend was
having trouble with because he pushes it down too hard (I did too)
and the Mac dealer said, "So? Don't push it down too hard." Gee,
thanks.
A bigger market doesn't necessarily mean better support. I'll take
Gribnif and Compo's support over Microsoft anytime. Even Atari, who
is always trashed for their customer service, has always been quick
to answer my questions over the phone or through the mail. I had
an experience with trying to call Apple and being disconnected on
twice. Of course, the phone lines were busy because of the success
of their Performa line, the phones said.

Please - stop that Mac vs Falcon -war... Both washmachines do have their good and bad points - even Mac..! I own a Falcon, but use Mac Quadra 700 quite a lot at work. I can't honestly say that I like Mac very much. The thing is pretty fast, colorful, and easy to use - in a way. But the OS..? It's a holy cow in my humble opinion. Nobody seems to criticize it - and when somebody finally does, he will be stoned to death.. O.K - many people like Mac's OS - I don't. It thinks too much - does decisions that I'd like to do myself. It has some rather silly features, like that horrible file-selector (better maybe than Atari's own, but a lot worse than e.g Shareware-program "Selectric 1.10". Mac handles DOS/Atari-diskettes slowly and unreliably, no matter how so many people like to say this is not true. It goes to Nirvana quite easily, and...
Sorry, but while using Mac, I _too often_ get the feelinthat: "This damned machine is S T U P I D..!!!". More often than while using Falcon, or even PC.
And speaking of slow and fast: Falcon equipped with 040/66 isn't too slow at all.. TOS 4 OS is a lot faster than Mac OS, which makes even a humble 030 Falcon quite usable. Even pretty fast in many cases.
Well... I don't want to start computer-wars, but these are my personal feelings and experiences. Some other may have opposite experiences, but what does it finally matter..? Both Mac and Falcon are good computers =-) !

How do you know what IBM wants? What is with you with System7? System 7 is alot more useful than your garbage Atari OS. System 7 has way more utility

and funtionality than the Atari OS. So when is Atari going toimprove thier
bugy non supported OS and hardware? The answer is JAGUAR!

Boy you are ignorant about the Mac.

First off, multitos is not System 7 like and does not come close of having the features and functionality.

Adobe Photoshop is $599 from MacConnection plus $3.00 for over night shipping. There are programs like photoshop but less powerful and probably more in line with photo studio for about the fraction of the Adobe one.

Microsoft Word is $300 from MacConnection. But don't compare AtariWorks to it, please. ClarisWorks is free with the MacPerformas and is usualy bundled with the other Mac series.

As for me, I use Writenow 3.0 and will upgrade to 4.0 for $41.00 from Maczone. WriteNow is a full feature Wordprocessor that has more than the basics such as footnotes and print preview. Its an awesome program and needs only 400K of memory. Should be the standard for others to be judged from.

I'm turning a plea to stop the bickering into a bicker :> Your comparing the
top two Ataris to a mac that wouldn't make the top ten anymore (it seems that
it would be about 12th). Apple would only sell such a computer now as an
entry-level system for about $1000. If you want to compare high-end, compare
a TT to a 8100/80AV and a falcon to a 7100/66AV. Actually, I'll be generous
and let you compare the TT and falcon to my 6100/60AV. I can tell you that
you won't find the interface slower and the programs will at least be as
fast (emulation) or 15x faster (native).

No, the joke is on you if you think US prices are valid anywhere else
apart from the US. Wake up, smell the coffee, internet isn't a US college
based network. Who knows, maybe Apple is using cross-subsidies to keep
the prices oh-so-cheap and scewing everyone else.

>
>Ian

Well 3d0 is now selling for $480 U.S. around here.. that's about
the same as the Jaguar with a CD..

As for the games I saw, I played Crash 'n Burn, Total Eclipse, and
Wing Commander for the 3d0, Cybermorph, Crescent Galaxy and Raiden for the
Jag..
Tempest 2000 is a killer game but it's still not as sexy as the
3d0 games IMO, I want new games not crap rehashed from 1980 dammit!

>of them.

Actually, yes. And none of them worked :-)

No, really. We DON'T have a single development system. We could not even
get some Jaguars for testing purposes (they were `out of stock')! I do have
the docs however. Atari is even worse than Commodore as far as tech-support
goes.

Almost every game is rehashed from the 80s. I prefer the older games in which gameplay mattered and not just eye candy. 7th Guest looks nice and has great sounds on a PC, but the game itself really is lacking. How many times do you want to watch the same animation sequence and hear the same (annoying) voice? I'd rather be playing Tempest or Llamatron or Joust, thanks.

Allright, Pete, back up your claims. What is so buggy about TOS 4.04. How many times have you crashed it? I have never crashed it with software written to be compatible with the Falcon. The only time I run into problems is with older ST software. And than I can run Backwards. Why is System 7 better, Pete? I am interested to know what you like System 7 for. Of course, you have used the newest TOS, haven't you? And I am sure that you've tried both Gemini and Neodesk, both much better than System 7, IMO. And you've used Geneva, Pete? Actually, have you ever used a Falcon, Pete? I seriously doubt it. Of course I am ignorant about Macs because I don't know how much MacWarehouse sells Photoshop for nowadays. I thought only Atari users had to mail order, Pete. Isn't that what you said? I mean, you have 50 Mac dealers within walking distance of your home, right? My price for Photoshop came out of AmigaWorld, BTW. I was giving list for Studio Photo too, but I get flamed for posting list prices. I have seen $79 for Studio Photo.

You have no idea just how wrong you are.

What kind of "support" do you get at those Mac and IBM stores?
Answer: Very Little. The people in those stores are generally quite
ignorant, and very unhelpful - I know this from having to deal with
mac/IBm stuff at a previous job.

You want support for software packages? How about those 900 numbers, eh?

I have generally found the Atari userbase to be quite amazing. Sure,
you have to have some kind of computer connection (genie or internet),
but I always get questions answered quickly and thoughtfully.

In addition, the software writers for the IBM and Mac are generally
not very helpful. But for my Atari, I can do things like call up the
company, suggest a helpful feature, and Voilia! it is in the next
version.

In short, I get a lot more support from the Atari community than I was
ever able to get for MS-DOS and Mac stuff.

The reason Calamus is not a best seller is quite obvious - just like
you say, Atari has a small userbase. For features and quality of
program, Calamus can match XPress.

>
>>What is wrong with System 7 you ask? It is slow (IMO) and takes up

>all of System 7's features? Built-in file sharing (connecting a single
>cable to two computers and clicking a few buttons)? Support for multiple
>languages? Drag and drop ease of use? Virtual memory? The scores of other
>features?

Yep. With just one program, I can connect two ST's together and have
the other computers HD appear as an icon.

I can have Virtual memory, plus real preemptive mutitasking (which you
can't).

Support for multiple languages? What exactly do you mean by this -
and do you use it? (the answer is of course no).

>Besides, you're comparing apples and oranges (no pun intended), really.
>TOS is a ROM-based operating system, is it not? Of COURSE it won't take up
>lots of RAM if it's ROM-based. That's a plus, sure, but how about

>

MTOS is a part RAM, part ROM OS... or it can be all RAM, you can load
different version of TOS from disk if you wish (takes up a few hundred
K, but still smaller than SYS7).

Just like all of the mac stuff - If you want something usable, you
have to pay extra. I've used that stupid normal Mac keyboard, and it
is unusable for all but the most casual user.

My criteria for what makes a "dead" platform is that the company has officially stopped supporting it. I.E. Atari 8 bits and NeXT hardware is dead, but the Falcon and NeXT OS are not dead. Plain & simple.

Chris

1792. Mac, PC, Atari and Amiga go home..

Newsgroup: comp.sys.atari.advocacy
Date: 1994-04-10 03:25:42 UTC
From: THIETAVUO@FINABO.ABO.FI
Message-ID: <1994Apr10.032542.6155@abo.fi>
Source record: 17642

How can you - who try to point out, how magnificent Mac is compared to Atari.. - really make those statements: "Everything on Mac is 100x faster, better working, cheaper, prettier, sexier..." ? Seems like many of you haven't ever used good TOS-programs (yes, they do exist!). Programs like Calamus SL (I wouldn't replace it with PageMaker ever!), Chagall, Papyrus (THE word processor..), Connect (very powerful terminal program), Cubase Audio (I know, it's for Mac too), etc.

One can hear that same stuff everywhere: some Mac-maniac tells you, how revolutionary and fantastic his/her System 7, or Performa is - and remembers to remind you how miserable that "Atari-thing" is. Poor us Atari-users..! ;-) The problem is that no matter how much I use the Mac (yes, quite good ones, with latest good programs) - I never get that feeling: "Wow! My own machine could _never_ do this so fast, easily and well.." ! There must be something wrong with me, but I honestly prefer TOS 4 desktop over the Mac desktop..

Yes, technically Macs are better than today's Ataris. But as long as I get my work done more pleasantly with Falcon or TT (or some 68040-Atari, like Medusa) ... Why complain? Calamus SL has made many laughers quite silent. As long as such Atari-programs exist, there's no point changing the system. For many people, the hardware seems like some possession. So the TT isn't as fast as Power-Mac. So what? For many uses it's really fast enough. And in many purposes faster than any Mac-owner would believe. Especially in DTP- and other graphical work. It's very easy to judge computer's "goodness" just by numbers: 68040 is more than 68030, etc. But that kind of judgement is... Useless bullshit, as any expert can tell. Well done 030-computer can be very fast - as poorly made PPC -computer can be quite slow. The TT is very fast - equipped with lots of Fast-RAM, good graphics card (like Matrix TC-1208), a fast SCSI-hard drive, etc. We have one such beast at work doing _very_ heavy DTP and image processing, connected to a SCSI color-sublimation full-color printer.

What makes the system interesting, is this: each (!) DTP-document we print, are size of 20..30 megabytes. How long does it take from a Mac to load a 30 MB DTP-document into e.g Quark or PageMaker..? The combination TT and Calamus SL loads it in about 15 seconds. Not bad..? And what about printing? Our TT does the whole color-separation (yes, Calamus SL does that "on fly") and printing process in 3 minutes. Again - how would a Mac compare to that..? I guess, some of you don't believe these numbers - or think that there is something strange behind them. But they're true. And they are the reason why our firm chose Atari-hardware, instead of PC's or Macs.

I don't want to say that e.g Power-Mac _couldn't_ do the same - but we know what Atari TT is capable of. It's a good workhorse.

P.S: that 30 megabytes includes 10 digitized True Color pictures (full-size SVHS), lots of vector-graphics, and vector-text chains. There is 36 MB RAM in

the TT, and 1.1 GB Hewlett-Packard hard-disk.

tsh, tsh, tsh...

My campus reseller has the Mac LCIII 4/160 with keyboard for $827
The 4/80 sells for $721.

However, the Quadra 605 4/80 is a much better buy sells for $827 plus $65 for keyboard.

As for the OS, its your opinion and preference. I have seen screen shots of System 7.5 with Wordscript. Awesome! Very professional as usual..

>fall '93. Do NOT try to pull any hardware lies on me.

You must have been fired. :) If, then, the Mac IIci (for example)
doesn't have stereo sound, then perchance could you tell me why my own
IIci *does* have stereo sound - and I can easily demonstrate it, if you
wish? There are no "hardware lies" here, Chris. Simple fact. In fact, I can
prove stereo sound on all of the machines that were originally mentioned.

Here, for your reading pleasure, is a verbatim excerpt from the Macintosh
IIci Owner's Manual, page 111:

"Sound generator: Apple Sound Chip (ASC) including 4-voice wave-table
synthesis and stereo sampling generator capable of driving stereo
miniature phone plug headphones or stereo equipment."

It's also fun to play "Pathways Into Darkness" hooked up to amplified
stereo speakers. Walk past a door on the right, and when it opens, you
hear the sound of it opening on the right speaker only. Rotate while the
door is opening and the sound will "move" accordingly.

Mac bashing is fun when you don't know what you're talking about, right
Chris? :)

>"yup sure!" I say one ambiguous statement and you jump down my throat. Well,
>that was the exact intent of my post. :) I don't care to justify it at all.
>THank you for allowing me to anger you.

First, you didn't anger me. I'm really curious how this could be. My IIci
runs with a 25Mhz 030 and I'd *love* to know how to make it keep up with a
25Mhz 040 CPU - and as I said, I'm sure lots of others are curious, too.

But, since you don't care to justify it, that likely means that you can't,
which I can accept.

I reply to any *false* anti-Mac statement that's made, regardless of who
it's posted by. You (Chris) have posted some of the most rediculous and
false accusations I'd ever seen, so you get the most "attention" from me.
Personally, I don't care if you like Macs or not. I don't care if you want
to spend your dying days bashing the Mac for one reason or another; I, for
one, have better things to do that put down other computer platforms.
However, if you DO take pleasure in doing things like that, at least have
the brains to know what you're talking about. 'Cause if you make a false
statement, I'll be there with proof and fact. :)

>use it is to pirate it. Down in the affordable range, Atari and Mac
>have many similary featured products.

Not from what I've seen. I can point to several "Plain Joe Affordable"
packages (read: $40-$150) that put the "best" of what the Atari has to
offer to shame. One of the nice things about the Mac is that there's LOTS
of software competition. WriteNow is probably the leading budget word
processor on the Mac (about $40) and it's absolutely loaded with many
"high-end" features. The best thing about the Mac is that almost every
software package works with others; WriteNow (or any other WP) files can be
brought into virtually any Mac DTP, word processor, database, etc program.
And if for some reason it can't, the host program can almost always save
the file in another format that the client application CAN read. The same
CANNOT be said for the Atari.

>>And yes, a 33Mhz 030 *does* perform better than a Falcon. It's not simply
>>the machine and the CPU, but also the software that runs on it. Show me,
>>for example, a word processor on the ST that can contend with Microsoft
>>Word. Or a desktop publishing program that can compare with QuarkXPress or
>>PageMaker. Hell, even Atari *magazines* aren't produced on Ataris!
>>MacWorld and MacUser, for example, are about 80% produced on Macs. How
>>many full color, internationally distributed, 250+ page Atari magines are
>>there at are produced on Ataris? There's a reason for that.
>Poor example - AW, or just about any new Atari WP is much better than
>MW. And calamus can easily take on Quark X-press.... with Pagestream
>being able to do almost anything you would want to do for even less.

I used Word as an example of a popular business and home application that
has, for the past several years, set the pace for all word processors on
all platforms. Personally, I dislike a lot of things about Word. I use it
primarily because it can read 99% of the word processor files I feed it,
which is really nice. If I need to do word processing, I prefer to do it

in QuarkXPress, actually.

Let me tell you something. I've used XPress and I've used Calamus. I've used them both in personal and professional capacities. I can honestly and without reservation tell you, from a professional standpoint, there is *ABSOLUTELY NO WAY WHATSOEVER* that Calamus can compete with XPress. None. Zero. Zip. Nada. Won't happen. Calamus on the ST is roughly equivalent to Ready Set Go (earlier than version 6.0) on the Mac; it's a nice program, but it's sorely lacking in several features that are practically vital in a professional capacity. I've had fleeting contact with Pagestream, too, and I came away suitably unimpressed.

>The reason Atari computers don't have 250+ page magazines in full
>color is not that the Atari software lacks - it's that the user base
>is not large enough to support such magazines.

Now think about why the user base isn't that large. My guess? Because Atari US doesn't give a crap about its userbase. It's producing underpowered, overpriced computers. They can't get a single major business developer interested in supporting the ST (Microsoft? Borland? Lotus? Aldus? Adobe?), and - like it or not - without the business software, the computer won't catch on in the home. History has proved this repeatedly.

>>Atari software doesn't require much horsepower for the simple reason that
>>it doesn't *do* much that requires a lot of horsepower. Run a program
>>that's "comparable" to, say, Adobe Photoshop and tell me how powerful your
>>16Mhz 68030 is.
>You forgot about a DSP, which some of the newer graphics packages use
>- and which can overcome the speed defeciency. Heck, I can look at
>JPEG's as fast on my Falcon as on a 486/50Dx...
I haven't seen the speed difference first-hand, but I'll take your word on it. Now, where's that program that's "comparable" to Photoshop on the ST?

>>And what's wrong with System 7?
>Some people do not like it. Hey where's that real multitasking?
True. And I also concur with your multitasking gripe, too. (And for the record, "real" multitasking will be part of the PowerPC architecture sometime next summer, current reports say.)

>I hope this resovels this issue.

"Resolves," btw.

And no it doesn't resolve it, because your LC III *does* have stereo sound capabilities. First, check your owner's manual. Second, for *absolute* proof (that's also the least expensive, btw) download "Sound Manager 3.0" from your favorite ftp site and install it. This little extension package gives the user (and programs) a lot more control over the stereo channels than previous managers (built into System software).

If you don't have an external speaker setup plugged into your SOUND OUT port, the Mac will use its internal speaker - which is mono. As soon as you plug a STEREO connector to the SOUND OUT port, you get stereo sound - as do many many many many many other Macs.

Well, since the conversation in question is referring to the US market, there's no comparison necessary to other markets. I'm well aware that the Atari is more popular in the UK; I've never disputed that. The issues here are in regards to the US market, though.

Now I try to keep up with PowerMac prices, as that is my world.
And I really hope that is a legit price, but CompUSA charges
about $2,000 for that configuration and they've been pretty
darn competitive out there.

Are you sure that's not a 6100/160? I've seen that for as low
as $1,500 retail. I find it hard to belive that they can up
the HD _and_ add a CD player for a lousy $150.

If true, that will make many of my friends very happy.

Where did you see this ad? Their catalog? Could you
post their 800 number?

Someone mentioned that their is a program called Retouche Pro for
the Atari that approaches Photoshop in capability. But what of the platform
that it's running on? My 6100/60AV is hardly powerfull enough to run
photoshop (blurring takes nearly a second!!!) so how would a TT do? Adobe
has publicly stated that the 68K line is maxed out for image performance
and a 33 MHz 040 is hardly upto complex imaging tasks. A powerpc mac is
up to complex image manipulation. Adobe is going to have to invent some new
effects to justify progress dialogs :)

Look, I do have Sound Manager 3.0 AND I have external speakers. Even with the speakers hooked up, and sound coming out of them my only speaker option on Sound Manager 3.0 seems to be the internal speaker. (ie a new choice of speakers did not appear after I plugged in the external ones.) Also, I am still presented only with the 8bit/mono option for my sound out. If there is a way to get stereo sound I'd love to know. For the most part, I like having both channels of sound sent to the right an left speakers, I don't feel that it is necessairly better or worse than stereo, just different.

:>SB> with these arguments. I've got it on file if you don't recall it.

Griff here, I'm sorry Rickard but you are wrong here, the Falcon is very nice
BUT it has a 16 BIT bus, the reason the SWAP/LONGWORD write is quicker
is because there is more time between consequetive writes, THUS less
time to wait while writing to memory. With careful order of code (esp.
texture mapping and gouraud type stuff), you get near the speed of a 030 with
a full 32bit bus.

>SB> Also, all my statements are backed up by solid facts, and not just

Yes it is wishful thinking to the Falcon has a 32bit bus, but it is not that
much of a problem with careful programming.

the answer is quite simple - without the Mac OS, and with more support
chips than the Mac has, responsivness and screen stuff on my Falcon
are about the same as that 040 machine...

Of course for raw computing power, the 040 is faster - but the raw
computing power of a platform does litte for most people most of the
time. Mostly it is the responsiveness and crispness of display that
give the "feel" of a machine.

>

Gee Whiz, you can take just about any Atari WP program, output it in
native or something like RTF if you're desperate, and load it into
Pagestream or Calamus.

Also, what company produces WriteNow? I am just wondering if it is
the very same WP program for the Atari... And also, what amazing
features do you think it has that Atari WP lacks? I have used many
Atari and Mac WP's, can you say the same?

But MW is a very poor choice to show off what the Mac can do. What
kinds of files can it read in that you are so sure Atari WP's can't
handle?

Also, MW spell checker is an affront to mankind - my current favorite
is Atari Works, followed by Word Perfect. And that's in terms of ease
of use, which the Mac is supposed to be good at!

Yep, all of that is true. But guess what - I don't care!! I like to
program the thing, and despite what you say, for the average user the
Atari software is generally as feature rich (if not more so) than mac
or IBM software, though not always as easy to use. But thebn again,
Mac's are computers for non-computer people mostly.

Hmm... called Redactur, or something like that. Also, a company
called Pheonix (probably spelled that a little off) puts out a whole
line of very professional graphics packages, which together do more
than Photoshop does (like animation and rendering and so on), though
together would probably cost about as much as Photoshop (you did buy
photoshop, right? I get the impression all mac users own a "copy" of

it...)

Now what these programs will not have is the seemless interface that
Photoshop has. Like most Atari programs, they are a little rough
around the edges.

>>>And what's wrong with System 7?

>

The only thing I wonder is what Apple will do when Taligent finished
the new OS. Will they dump SYS 7 in favor of that? It's nice to see
they are finally putting the multitasking thing to rest.

The only other disquiting thing that I find about Sys 7, is using that
damn pascal string converter whener you have to give a C string to
some OS call.

I would say "dead" is when a company stops production, and says "we
are no longer producing this model". Interestingly, this applies to
the C64, Atari 800, and non-powermac Macintoshes (which they have said
they will no longer produce in the future).

1812. I heard someone say C64

Newsgroup: comp.sys.atari.advocacy
Date: 1994-04-11 06:45:00 UTC
From: flaxman@jhuvms.hcf.jhu.edu
Message-ID: <11APR199402455906@jhuvms.hcf.jhu.edu>
Source record: 17663

This atari vs mac is one I don't wanna get into. Especially since I have an IBM (although now I do support for certain programs on Macs, as well).

However, I heard someone mention C64 and I wanted to ask, does anyone have any old software on disk or cartridge that they would be willing to sell or otherwise part with?

I have given an old C64 (or was it a 128) to a friend overseas and would like to give him some additional software (especially games).

If you have any such software, or know where I can get some, please email me at flaxman@jhuvms.hcf.jhu.edu (flaxman@jhuvms.bitnet).
Or you may call me (Alex) at 410-366-7906.

Feel free to forward this request to anyone/everyone/anywhere/everywhere.

Thanks for your attention,

A

Actually that has to be true. MACs are WAY cheaper in USA than in any other country, and the only explanation would be that Apple earns the money in the small (but with big profits) European market, and sells a lot of hardware (but earns very little, if anything) in USA.

Is there anything in the Apple-retail policy that forbids dealers to export machines? What would happen if I started a company that imported lots of cheap Macs to Europe? (For one thing, I would be very rich very soon)

Hi there,

I'm looking for a tool, which converts documents written with Signum into ASCII-Format, PC-readable. Does anybody know about such a tool?

It would be even better, if this converter could produce RTF-Output (Rich Text Format) or (the best) WordPerfect 6.0 output.

But I would be even satisfied with a raw description of the *.SDO-Format to write my own converter.

Any hints welcome!

Tschoe

I think that Signum!2 or !3 has a function for exporting ASCII - where is
the problem? (All other ideas for converting a signum!-file are not
realistic. I think that there are no converters for any other format than
ASCII available.)

Where quantity = # of units sold by Atari +1. It seems to me, nomatter how
many of anything Atari sell, Peters idea of quantity is that number plus a
bit.
There are probably 2 million or more STs out there. Does that count as
quantity? Can we say that STs are more popular than AV Macs?

I believe this is not the case anymore. Atari is an also ran in the UK market.
Atari's worldwide sales in 1993 were $28 million, while Apple Europe alone had
TWO BILLION IN SALES!(Apple's annual report) Apple'sPerforma line has done
well in the UK.

The first problem was, that I did not knew about that, since it's not me being concerned, but a friend of mine, who has "two left hands" when working with computers. If you tell him "ASCII", he asks, where this Ski-Area can be found ;-)

The next problem, I was told about: this ASCII-export does not save any formatting. But there is a converter (sig2asc) which at least keeps *some* formatting information (such as centering e.g.).

And I think, the idea of converting signum-files into RTF ist not so unrealistic, since with RTF, 99% of the formatting and the typeface information can be saved.

>(Oh, and you DO know that a 4/85 Falcon is 9995:- ? Including V.A.T)

I hate to disappoint you, but here's the proof for you:

Macintosh LC 475, 25MHz 68LC040, 4MB RAM, 80MB HD

Price: SEK 9730,- VAT Included

Macintosh Performa 450, 25MHz 68030, 4MB, 120MB HD, 14" Color monitor

Price: SEK 11995,-
Price without monitor: SEK 8385,-

I didn't look very far to get these prices, "Linus & Linnea AB" here in
Linkoping. If you shop around a bit you can get even better deals.

>SB> I refuted with these arguments. I've got it on file if you don't recall
>SB> it.

>Yep, and I Emailed you the answer, which killed your so-called "proof" ...
>weird though .. you never answered the email .. wonder why ...

It "killed" my "proof" ?? Bah. It just showed that you didn't have a clue
what I was talking about, that's all. And as for why I never answered your
e-mail; I get hundreds of e-mails every month, and I don't have time to
answer them all.

Here's some food for thought:

Which is faster:

```
A: B:
swap d0 swap d0
swap d1 move.l d0,(a0)+
move.l d0,(a0)+ swap d1
move.l d1,(a0)+ move.l d1,(a0)+
```

If you take your simpleton approach and just count the execution cycle
times, both should be the same speed. But they are not. B is faster, because
it uses interleaved memory accesses.

>SB> Also, all my statements are backed up by solid facts, and not just
>SB> inference and lots of wishful thinking.

><big grin>

>I'm sure you have a Falcon to try it on too, right?

No, but I have a solid understanding of how Motorola microprocessors
work in real-life situations. That's all I need. I have lots of experience
in M68k optimization. You can try comparing the Atari version of LhA with
the Amiga version, which I wrote, for example.

I can accept that, since it does not mean that you get half the performance, which was the original claim by Raist (and others, like Gavan)

(BTW; the issue was never about 16 vs 32 bit bus, but if the bus had been tampered with to allow a bigger flow of data. i.e multiplexed or something like that. simple move.w/move.l comparisations DOES indicate that the bus is faster than a plain 16bit bus)

M> >I'm sure you have a Falcon to try it on too, right?

>whether you want to believe so or not.

Let me tell you something. I've been an Atari owner/user since *1979* with an Atari 400. I've progressed to an 800XL and then a 1040ST. I, too, used to preach the "Atari still has a chance to turn it around" argument on a near-daily basis. Know what? For over a decade, it's never happened. How much time does Atari need?!? They got severely trounced by Commodore in the Eighties and everyone said "they'll be back." They got fairly trounced by the Amiga in the late Eighties and everyone said "they'll be back." Now they're losing more market share to the Macintosh and PC platforms and people are STILL saying "they'll be back."

Fine. I've been waiting for more than ten years. When will they be back?

>AmigaWorld, BTW.

I'm not Pete, but you arouse my curiosity.

Atari users are, for the VAST majority, *limited* to mail order simply
becausee there are scant few Atari stores around. For Mac owners, it's an
alternative. There's precious little (usually) difference in buying
software from mail order or from CompUSA, but it's noce to have the choice.

My curiosity is aroused by your source for Photoshop. Photoshop is
available for Mac and PC platforms. How does AmigaWorld advertise a
program which isn't out for the Amiga? Someone *might* be advertising it
for things like the Emplant emulator (which suffers from massive false
advertising claims, anyway), I suppose.

I love all those games too, but I'm afraid that Ronald Reagan
isn't the president anymore. If all I wanted to play were those games,
my old ST does just fine.
I agree that most of the games now are utter shite. Lots of
neat graphics with zero playability (and Seventh Guest does fit those
criteria.) But there have been some games that kick ass that are new -
I've wasted countless hours playing Pirates! and X-Wing.

Message-ID: <94101.215443STIRRE31@MAINE.MAINE.EDU>
Source record: 17685

No, there wasn't an ad for Photoshop in AmigaWorld. I was referring
to an article which compared the prices of buying an Amiga, Mac,
and PC and software for them (want to know which one? ;-)). Yes,
the price that I posted is list but so are the prices which I have
been posting on Atari software so I think that's fair.
I do not agree that Commodore and the Amiga has "trounced" over
the Atari computer line. In the 80s the ST was the most popular
computer in Europe. And, not to offend C= fans, Atari has apparently
done much better than C= at staying afloat (not to say C='s dead).
The ST and Amiga are pretty much in the same boat in the computer
market- dwarfed by the PC and Mac. I'll readily admit that. But
to say that Atari has no chance to turn it around is perhaps being
premature. The Jaguar has shown Atari's willingness to advertise.
What happens if an Atari Power PC is introduced after Jag's success
(yes, this is theoretical) and it is advertised? It will do well,
IMO. Just a little while ago Apple fans were disheartened by
Apple's financial reports and they turned it around.
I would also like to point out that there are two rumors right now
regarding Atari computers....
1) Atari has a finished Falcon040 ready but are waiting for a certain
sales figure on the Falcon030 to release it. (source: PDP
Magazine).
2) Wizztronics is working on the Atari Power PC computer. (source:
Current Notes Magazine).
Also remember that Atari clones are coming out. It might not just
be up to Atari anymore. If I am wrong and Atari computers are dead
than I will probably get a Power Mac down the road. I have been
using Atari computers since 1983 (when I was 8 yrs. old) and they
have always been enjoyable and reliable. I am not going to switch
after that track record. You look at market share and sales
figures, but I'll stick to looking at my personal experience with
the platform.

In article <9403290916.AA11561@nyx.cs.du.edu>, gmoran@nyx.cs.du.edu (Gavan Moran) writes:

Compare how much PERFORMANCE you actually get on software and you`ll find out you`ve wasted your money to get a toy that can do reasonable emulations of a Mac and PC.

Gavan.

People are not buying PowerMacs to run PC software. They are buying them to do some things that require very very very fast floating point computations (Fractal Design's Painter, Adobe Photoshop) whilst working in a familiar operating environment that lets one use a lot of older software at a reasonable speed. The PowerMacs probably are not going to gain market share away from Intel/Microsoft for the first 2 years or so, anyhow. SoftWindows is just for those who have a few DOS/Win apps that they must use (as in a business or academic situation), and SW lets them do it at 486sx speed. It is like getting an extra computer for $300, which isn't so bad.

The blazing app speed in PPC is now concentrated in speed-critical apps. Noone is going to run their cycle hungry app under emulation; that is stupid. For those who have an app that isn't yet recompiled; they can hold off on getting a PPC until it is.

What the PowerMacs do is basically give people a workstation that lets them use their old software and familiar OS, with the penalty that the old software runs at the old speed.

Source record: 17487

-> Well 3d0 is now selling for $480 U.S. around here.. that's about the
-> same as the Jaguar with a CD..

There are some mail order places that are selling the 3DO for $450u.s.

-> As for the games I saw, I played Crash 'n Burn, Total Eclipse, and
-> Wing Commander for the 3d0, Cybermorph, Crescent Galaxy and Raiden
-> for the Jag..
-> Tempest 2000 is a killer game but it's still not as sexy as the 3d0
-> games IMO, I want new games not crap rehashed from 1980 dammit!

That is the only reason I'm delaying my purchase of the Jaguar.
However atari has announced 51 developers and around 50 titles in the
works. We should atleast see in 4-6 months now 50 titles being
released. The 3DO on the other hand since I own a pc system and cdrom I
might as well wait til they bring out the 3DO PC card it should cost
around $200u.s. since whats the sense of wasting money on buying
another cdrom when I own one already?

Green Card Lottery 1994 May Be The Last One!
THE DEADLINE HAS BEEN ANNOUNCED.

The Green Card Lottery is a completely legal program giving away a certain annual allotment of Green Cards to persons born in certain countries. The lottery program was scheduled to continue on a permanent basis. However, recently, Senator Alan J Simpson introduced a bill into the U. S. Congress which could end any future lotteries. THE 1994 LOTTERY IS SCHEDULED TO TAKE PLACE SOON, BUT IT MAY BE THE VERY LAST ONE.

PERSONS BORN IN MOST COUNTRIES QUALIFY, MANY FOR FIRST TIME.

The only countries NOT qualifying are: Mexico; India; P.R. China; Taiwan, Philippines, North Korea, Canada, United Kingdom (except Northern Ireland), Jamaica, Domican Republic, El Salvador and Vietnam.

Lottery registration will take place soon. 55,000 Green Cards will be given to those who register correctly. NO JOB IS REQUIRED.

THERE IS A STRICT JUNE DEADLINE. THE TIME TO START IS NOW!!

For FREE information via Email, send request to cslaw@indirect.com

Pirates! a new game? Are you talking about the Microprose title?
I'm playing that on my Falcon and loving it :-). Everyone hyped
up X-Wing beyond belief, but I thought it was very unimpressive.
But than again, I didn't like Wing Comannder either. I thought
the polygon graphics looked lacking (especially on the big star
cruisers). It WAS smooth, though. Personally I like Epic on
the ST and the original Staw Wars arcade game- now that was a
game.

SCSI-I (Difference to SCSI-II is negligible for normal use)
1.44 MB Floppy
80 MB Harddrive
512 KB VRAM
4 MB RAM
2 Serial ports
8-bit audio ADC (=sampler)
Mouse
Keyboard (standard)

>SB> Price: SEK 9730,- VAT Included

>Ouch .. 200 less .. let's add the above mentioned Falcon-standard-features.

Okay, then you must add the cost of a 68040 to the Falcon then. Fair, no?
Oh, I forgot, you can't get a 68040 for the Falcon.

>SB> I didn't look very far to get these prices, "Linus & Linnea AB" here in

Two million 68000 ST's, soon in the landfil! Atari annouced the Falcon
prematurely. The installed base of AV macs is about 300,000 since last August
according to Apple insiders.

Absolutely! It's nuts to buy one computer to emulate an other.
You buy it for the raw speed it offers for native code and
emulate for the shortest time possible as a transitional
thing.

1853. Does the 16+(extra midi port) works with Falcon?

Newsgroup: comp.sys.atari.advocacy
Date: 1994-04-13 10:09:38 UTC
From: S925377@mailserv.cuhk.hk
Message-ID: <S925377.26.0@mailserv.cuhk.hk>
Source record: 17504

Hello,
I'm using 16+(from Hands On) with Cubase to provide extra 16 midi channel,
on an STE.
If I upgrade to Falcon, does it works with cubase Audio or just the Cubase
3.1 I'm using?
Also, can anyone send me information about Cubase Audio? Does the cartridge
of Cubase 3.1(the red one) works with Cubase Audio, so that only software
upgrade is needed instead of hardware upgrade? You know, it quite
inconvenience to upgrade the cartridge as there's no distridutor here.
Please send mail to me directly if possible.

s925377@mailserv.cuhk.hk

Thanks in advance for your help.
Good Luck!
Malcolm

SCSI, although the Falcon's SCSI-II is not a true SCSI-II anyway.
On the other hand... it has a 68040.... surely to kick butt in general applications...

1856. Christmas Demo

Newsgroup: comp.sys.atari.advocacy
Date: 1994-04-13 13:35:54 UTC
From: rcmerrit@apgea.army.mil
Message-ID: <1994Apr13.133554.18910@apgea.army.mil>
Source record: 17507

Hi,

I saw something I figured I never see. A christmas greeting from Atari!
I was at a friends house and on his PC he showed me a quickfli of
an Atari christmas greeting. Basically it has a cat who would click
channels on a TV and "morph" into different things like a basketball
player, kermit the frog, a woman, spock, and a few other things. Then
someone comes in and thinks the dog was playing with the remote. The
dog gets kicked out and falls into the snow and hits a wall. Then
the snow on the wall falls off and it say seasons greatings from Atari.

1. I assume this wasn't made for the PC. There was no sound to it. It
did look great and was funny.

2. Did it come out for the ST? And when did it come out?

The Amiga has obliderated the ST in Europe! Atari Germany is kapult along with other European subsidiaries. ST sales in Europe are almost non existent. The Amiga has a 2-1 installed base over the ST and Falcon.

I am betting that C= survives in some form.

> 1) Atari has a finished Falcon040 ready but are waiting for a certain

I have an issue of MacFormat, a British mag. Computer WareHouse lists the Mac LC475 4/80 with KB and monitor for 899 plus VAT. This is UK pounds. The LCIII 4/80 with KB and monitor sells for 699 plus VAT. So much for your theory that Mac prices are higher than the competition

1865. "Atari vs Apple" Statement

Newsgroup: comp.sys.atari.advocacy
Date: 1994-04-13 22:39:46 UTC
From: lordthan@news.delphi.com
Message-ID: <2ohsbi$hh@news.delphi.com>
Source record: 17516

I've partaken in a fair share of the recent "Apple vs Atari" discussions that have been going on in this newsgroup, and I'm posting this letter in hopes of clarifying both my own position as well as a few things that many of my "opponents" claim to be factual information. While I fear that this letter will spawn a whole new series of "oh yeah?!?" posts, the intention is that it will instead end many aspects of this discussion.

First things first. I'm an Apple advocate, but not blindly so. I've owned both 6502 Ataris and 68K Ataris as well as my Macintosh. I know both sides of the argument first hand. In my opinion, blind loyalism is *not* an indication of an intelligent computer user. Intelligent users recognize the strengths and weaknesses of their chosen platform(s) and don't try to hide under false accusations or assumptions without proof; "just because" is not a valid reason. I like my Macintosh; it's the best computer I've ever owned and (IMO) there's absolutely nothing comparable to it in the price range on the market. I also like my Atari (both 8-bit and ST); it's got one of the most stable OS's I've experienced and plays some pretty good video games. So let's have it known that I'm *not* bashing or biased, in either direction, as I own both platforms.

Furthermore, I'd like to have it understood that, in all of my statements and unless otherwise indicated, I'm referring to the *US* marketplace ONLY. I am in no way referring to any overseas marketplace. Those markets are not part of this discussion at all so far as I'm concerned. I'm aware of the differences between the two markets. The first person who replies to this letter with "over here in <<insert overseas locale here>> the Atari leads the pack" will be considered an ignoramus and will not warrant a reply.

Finally, I'm aware that this newsgroup is comp.sys.atari.advocacy and, technically, this post doesn't belong here. My argument is this: I don't mind if people wish to bash or otherwise put down the Mac (or any other system) in this newsgroup *PROVIDED* that he or she has all of the facts straight. If you want to bash, fine. Personally, I've got better things to do with my time. But make sure you've got the facts to back your claims up. Otherwise you're just blowing hot air.

With all that in mind...

There seem to be several key arguments in this debate, several of which I will briefly outline here. If you can come up with another *relevant* argument, in either direction, please do.

CLAIM: "The Atari is cheaper than the Mac."
FACT: In general, this is untrue. A 25Mhz 68040 Macintosh (w/built-in sound sampling, on-board 8-bit video, and a PowerPC-upgradable motherboard) with 8-MB RAM, a 120-MB hard drive, StyleWriter II printer (360dpi inkjet),

keyboard, mouse, 14.4K baud fax-modem, System 7.1 and ClarisWorks software (and, sometimes, other software bundled with it depending on where you buy it from) can be had for less than $1000. No matter how you slice it, there isn't an Atari around that can match that. "Power Without the Price" was valid several years ago; today, it's wishful thinking.

CLAIM: "The Atari OS is better than the Mac OS."
FACT: This is strictly a matter of opinion. Personally, I prefer the Mac OS for a variety of reasons. (If you wish to know what they are, let me know. In the interest of brevity, I won't get into it here.) Keep in mind that the Atari OS was modeled after the Mac OS; remember the catch-phrase, "a Macintosh for the rest of us" that Atari was spreading around during the introduction of the ST? There's a reason for that.

CLAIM: "Atari (and third-party) customer support is better."
FACT: This claim will vary from person to person, but in my experience the opposite is true. I've had Atari service technicians actually do purposeful damage to my ST when I brought it in for repairs. I've had to wait for days for an Atari tech support person to get in touch with me, and that was after several follow-up phone calls. I've waited on hold for upwards of an hour to talk to someone at Atari who barely knew their own machine! On the other hand, Apple has always answered my questions without hesitation. Microsoft practically goes out of their way to make sure everything is working. Claris, Quark, Adobe, Aldus...They've all given me the help that no Atari-oriented company ever has.

CLAIM: "Atari software is cheaper and/or better."
FACT: I've used both platforms in a personal and professional environment and there is precious little on the Atari that can even attempt to compare with software on the Mac. Full-blown word processors on the Mac can be had for as little as $40. Full blown PostScript drawing programs can be had for $30. Color paint programs with basic photo retouching tools can be had for $25 or less. True, some programs are a bit pricey (QuarkXPress, Photoshop, etc) but...You get what you pay for. Some people mistakenly think that Calamus on the ST can compare with XPress (for example). It can't. I've used both in a personal and professional manner and it simply cannot compare.

CLAIM: "The Mac doesn't have stereo sound."
FACT: This is a myth perpetuated by the blind loyalty of many Atari enthusiasts. The truth of the matter is the Mac has had stereo sound for many, many years. Plug a stereo mini jack into the SOUND OUT port, connect it to a pair of amplified speakers and you've got stereo sound. Sound Manager 3.0 (from Apple; free) gives the user more control over sound channeling, too, while several games and multimedia packages have been exploiting Mac stereo sound for years.

CLAIM: "Atari will be back and they'll be better than ever!"
FACT: Atari users have been making this ritualistic chant for over ten years; I know because I used to preach it myself. Atari has not "come back" in over a decade. They're in worse condition now than ever before! It was merely difficult for Atari to become a leading computer manufacturer ten years ago. Today, it's virtually impossible. They don't have an 040-based

machine while Apple and Commodore, Atari's main competitors, do. Their operating system is antiquated, the hardware is very closed and unforgiving, and no significant software developer will write programs for it.
My prediction: Atari Computers will eventually fade away into oblivion and turn its resources to the video game market where it at least has a fighting chance. Everyone recognizes Atari as a video game company; not many recognize them as a computer company. Their Jaguar system is more technically advanced than their home computers; doesn't this get you wondering about where Atari wants to go? At least with the Jaguar they have a reasonable weapon against Genesis and SuperNES (and their forthcoming 32-bit systems). However, I can't help but feel that Jaguar will also fail. Why? It's hardly advertised (the motto of Atari must be "don't advertise"). It's been out for quite awhile now and there's all of maybe half a dozen cartridges out for it, none of which are recognized top-grossing arcade hits (Mortal Kombat on the Jaguar would be oustanding; where is it?). Atari's only saving grace for the Jaguar at this point is to pray for the "Genesis Effect." Several years ago the Genesis was in the same situation as the Jaguar is now. When costs went down and people wanted something more than Super Mario Brothers, they turned to Genesis which then exploded in popularity. If the theory holds true, Jaguar will languish for about a year or so until people are tired of Genesis and SuperNES.

CLAIM: "I'm just saying this because I'm an Apple enthusiast."
FACT: No, I'm saying this because I've seen both sides of the fence and I'm aware of which side is greener. If Atari had proven to me that they made a superior machine, I'd be there. If the IBM platform were demonstratably superior, I'd be there.

CLAIM: "PowerPC has no future; Apple will go back to 680x0 CPUs."
FACT: Apple will cease production of all 680x0-based Macs by 1996, at which time all Macs will be PowerPC-based. There will be no 68060 Macs though several third-party companies have announced 68060 accelerators. The truth of the matter is that the 680x0 chips, like the 80x86 and other CISC chips, are at the end of their useful life. They've just about reached their plateau of usefulness. RISC chips are clearly the way of the future; any significant workstation uses them. Sure it's possible to build a CISC chip that's just as fast as a RISC chip, but at what cost? Given similar speed rates, a RISC chip will be smaller, use less electricity, generate less heat, and cost less to produce than the comparable CISC chip. What happens when the PPC603 comes out? Or the PPC610? In order for CISC chips to keep up, they'll have to be huge, costly, and use a pressurized freon cooling system to keep them from melting through your desk.
It's called EVOLUTION. Like moving from your 6502 machines to your 680x0 and 80x86 machines. Or from steam-engine vehicles to internal combustion-driven ones. Bicycle to automobile. Middle school to high school to college. CISC chips are at the beginning of the senior citizenship while RISC chips are just graduating college.

CLAIM: "Nobody wants to buy PowerPC because their existing software, IF it runs at all, will be really slow."
FACT: PowerPC in 680x0 emulation runs at speeds equating roughly from a

33Mhz 68030 to a 25Mhz 68040 - and emulation is flawless and transparent. No existing Mac software has been discovered (so far as I know) which will not run on the PowerPC chip. Furthermore, PowerMacs and their software will only get faster as time goes on and more and more developers recode their software for the PPC chip. Several shareware and commercial programs have already been rewritten. Those that haven't have had PowerPC release dates issued a long time ago. Oh yes...The PowerMacs have been selling just fine. Better, in fact, than Apple's predictions.
As a side note, I find the "slow" comment rather amusing. The "slowest" a PPC chip will run in emulation mode is approximately, as I said, a 33Mhz 68030. Does Atari have a machine with a 33Mhz 68030? (This isn't bashing; I genuinely don't know.) Is there a 25Mhz 68040 Atari? Unless there exists a faster-than-25Mhz 68040 Atari, no Atari enthusiast can claim speed as an issue. (Kinda like a VW Beetle owner yelling at a Corvette owner that his car isn't fast enough.)

CLAIM: "You make it sound like everyone should sell their Ataris and buy Macs!"
FACT: My personal theory is this: If your computer does exactly what you want it to do, and if you have a guarantee that it will continue to do what you want it to do in future years, then stick with that computer. Otherwise, move on. I moved from 800XL to 1040ST because that's where the Atari market was going; ST support was higher than 8-bit support at the time. I moved from 1040ST to Mac IIci for similar reasons. I *could* have invested in a Mega ST-4 or something similar, but I chose not to. Atari had not proven to me that they could provide me with the tools, support and architecture that I needed. Apple could (and did).

Slight apologies for the length of this post, but I feel it was necessary. Bash away all you want, nitpick and play word games all you want, make ridiculous claims all you want, but these are the facts and there's no disputing them. I'll reply to any logical argument anyone wants to post, though I request that these arguments come slowly as I'm fairly certain that this posting will cause a virtual armegeddon of blasphemous cries. Anyone who replies with an opinion and claims it as fact will be ignored. Anyone who replies with a claim and no supporting proof (i.e., "my 030-based Falcon can keep up with an 040-based Mac") will be ignored. Anyone who decides to call me names for whatever reason will be ignored.

Thanks for your time.

Laughable. Let me ask you something: Do you know exactly how your car works? Or how your water heater works? How about your television? Or your microwave oven? Can you honestly say that you know every facet of every operation of every item that you possess?
Why do you claim that people have to know about hardware and how it works in order to productively use a computer? Do you know how the valvetrain works on your car's engine? If not, then why are you still driving it?
And while you're answering all of those, answer me this: What "cutting edge technology" has Atari, Commodore and/or IBM (barring the PPC) introduced into their machines lately? Apple was the first in many, many fields, including on-board networking (AppleTalk and, later, EtherNet), built-in sound sampling, built-in speech recognition, and many others. In fact, AppleTalk is the de facto standard for low-cost networking for all business computers. What's cutting edge on the Atari? TOS? IMO, the last "cutting edge" thing Atari ever did (in their computers) was the built-in MIDI ports.

Very good points and I enjoyed the statement overall. However,
what are the specs on your ST? I mean, you do realize that the
ST came out in 1985 don't you? It is not fair to compare today's
Macs with yesterday's Ataris. And if you used Calamus SL in
a professional environment surely it wasn't on a 8Mhz 68000?
That'd be pretty slow I'm guessing. Yes, Atari has a computer
based around the 68030 32Mhz microprocesor, the TT. It is a
very nice machine from what I hear, but expensive. I get the
feeling that you haven't used a new Atari (ie. Mega STe, TT or
Falcon). If you haven't than I apologize. I also still contend
that software on the whole is cheaper on the Atari range. Full-
fledged word processors for $40 doesn't crush this claim. There
are also a few low-priced word processors for the Atari that would
fill most peoples' needs.

Cutting edge in the Falcon? 56001 DSP for starters. Still has
built-in MIDI. 16-bit stereo sound. Hey, it even has a Localtalk
port on it :-). Are you gonna tell me that isn't cutting edge :-)?
Oh, and I guess I forgot the pre-emptive multitasking.... does
Apple have that yet? :-)

Good post, even though a bit long. Don't we mostly blow hot air here anyway! I can't disagree with any of your points and I must agree that there are a number of people here that go overboard with their advocating of Atari. It's unfortunate that we have those types on all platforms. What it boils down to for me is habit and personal choice. I have been using Atari's since 1980 and rather like them, so I continue to use them as long as they do the job. I don't mind putting up with some of the hassles of a small market and little support. I use a Mac at work and I am sure that if I had chosen to go with that platform many years ago I would be happy with it too. Someday I may end getting a clone or PPC as they seem to be better supported for the home user. The only thing I really don't like is when others say that the Atari's are obsolete and no good for anything. Mine still works fine and gets everything done that I need it to do and I find I am still spending plenty on new software and upgrades for old.

So advocate all you want, but don't tell me I can't use my Atari!!!

RandyH

That wasn't much ... the 040 barely makes up for the lack of a DSP .. and you
loose the ability to let both processors work at the same time ..

512Kb VideoRam!? ... What graphicsmodes are available!?

8-bit sound ... not really.

I talked to "Linus and Linnea" and, yes, almost.

No keyboard, and it was 9900:- ... which means that you failed to show me a 040 Mac cheaper than a Falcon (you HAVE to have a keyboard) and that somehow you quoted their prices wrong. (I won't call you a liar though, anyone can quote prices and configurations wrong ...)
He also said it's "impossible" to add an FPU, which you easily can to the Falcon .. <grin>

However, much more interesting, I asked them about other configurations ..

Cheapest PowerMac: 19000:- (not 15xxx:- which Stefan claimed), and the 660AV (which according to them was the computer I should buy instead of my Falcon - I quoted the Falcon's specifications) was 42335:- (8/500 with a CD-ROM and a 14" screen)

After subracting the extra memory, harddrive, CD-ROM and Screen, the 660AV lands on ca 30000:-, which is THREE TIMES the price of the Falcon. (And the sales rep. on Linus and Linnea said himself that the 660AV was the choice I should make instead of the Falcon!)

Oh, Stefan, the top-of-the-line PowerMAC was 60000:-, not 48000:- which you claimed.

Oh, Stefan claims to only post FACTS.

Finally a sane thread in an advocacy newsgroup. I'd like to take it one step farther:
- the "platform" is becoming irrelevant as a reason to select a computer vendor (HW is just a commodity)
- the OS will become irrelevant, System 7, Windows, GEM, OS/2 are becoming more similar from a user standpoint (again, a commodity tied to HW, but not for long). All operating systems will emulate others.
- the application program will become less important
- the document will become the most important thing.

The document is what we produce with our computers. A document can contain text, pictures, data, tables, graphs, charts, voice, music, midi, and anything else we put into it. When a user clicks on text, the word processor of choice takes over. Click on a Graphic, the drawing program is invoked. Click on a table get your spreadsheet. The user will customize his application suite based on personal preferences.

The document will be the primary "thing" on the computer. It will exist independent of the applications which act upon it. It will exist at the highest level, above the applications, OS, and HW. Oh well, maybe someday.

My personal history: grew up programming minis is assembler and fortran, worked with a lot of IBM PCs trying to make them do productive things in the early days, got an ST in 1988 (didn't want to damage the kid with "C>" and a Mac Plus was 2.5 times the cost of the ST), corporate culture moved to Macs (less fun to tinker with, more productive cause I don't spend all my time tinkering). ST still chugging along, kid writes papers on it, I bring the disk to work, yank ascii into Word, print it out on the laser.

Next purchase, probably a high end 68040 once the prices drop. Heard that the GEMULATOR is being ported to the Mac, so I can salvage my Atari heritage. BTW, the local Atari guru is running his Atari stuff on a 486 w/GEMULATOR. Maybe we are getting to where the box doesn't matter.

[snip snip snip snip snip snip snip snip!!]
[blah blah blah deleted]

>Thanks for your time.

ya got that right.

What I am wondering (And obviously Lord Thantos will feel obliged to ignore
me) is that since lord Thantos has owned both platforms and claims to be
well informed and an objective debater, why does he merely post things
like:

Claim: "Atari is a good computer"
Fact: "It sucks eggs".

You'd think that if he was trying to be a well informed debater with
an objective opinion that he would try to present more than one side of
the argument. But I guess since I own an atari, my opinion sucks eggs
too.

.

|> in order to productively use a computer?

We're not talking component level here, we're talking basic RTFM knowledge that people should be expected to know or learn to use their computer. Would you expect not to have to take driving lessons and pass a driving test before you were allowed to drive a car? Of course not. There are lots of computer literate people who find the Macs 'hold my hand mommy' approach not only insulting to their intelligence, but also that it stands in the way of their productivity. Whenever I have the misfortune to use a Mac I find myself wanting to hit the stupid thing with a large axe after a few minutes because it is just so frustrating to use. Simple things like the scrollbars (can't have proper proportional ones now can we? The sight of it changing size as your window fills up is FAR too distressing for the poor little brain dead user), putting a disk that it doesn't reconise in: This disk is not formatted, do you want to format or eject it? Well, actually I don't want to do either but the stupid thing won't let me do anything else until it gets it's way. When I use a computer I expect it to do what I tell it to do. Not what it thinks I should have wanted it to do.

>Macs with yesterday's Ataris. And if you used Calamus SL in
>a professional environment surely it wasn't on a 8Mhz 68000?

My own personal ST is a 1040ST from circa 1987 (?). I've worked with an assortment of other STs, including the TT, the Mega-ST, and (briefly) the Falcon. Calamus on my own ST is horribly slow, true, but even on the TT it wasn't as fast as I would have liked it to be. QuarkXPress on the Mac, for example, isn't a speed demon on a 68000 Mac but it certainly "feels" faster than Calamus on my ST, if that makes any sense.

>That'd be pretty slow I'm guessing. Yes, Atari has a computer
>based around the 68030 32Mhz microprocesor, the TT. It is a
>very nice machine from what I hear, but expensive. I get the

I thought the TT was a 25Mhz 030. *shrug* Okay, point made.

>feeling that you haven't used a new Atari (ie. Mega STe, TT or
>Falcon). If you haven't than I apologize. I also still contend
>that software on the whole is cheaper on the Atari range. Full-

I have; see above note.

>fledged word processors for $40 doesn't crush this claim. There
>are also a few low-priced word processors for the Atari that would
>fill most peoples' needs.

I used that as an example, as most people seem content to post the list price for Microsoft Word and then assume that (a) this is a typical price for all Mac software, and (b) everyone pays list price. I don't doubt that there are low-priced WP's on the Atari. My point is that low-priced WP's (and other types of software) exist on the Mac that are *far* from being the "stripped down, next to worthless" pieces that some people have claimed.

BTW, thanks for the intelligent reply. :)

Well said; my point exactly. If you're happy with it, fine. The Atari just
didn't make me happy, so I moved. If they do what you want, then stick
with it; there's no reason to move elsewhere. (Heck, I know a girl who uses
an old Coleco ADAM! All she needs to do is some word processing for school;
she picked up the whole system, used, for $20 and it's perfect for what
she needs.)

>I don't mind putting up with some of the hassles of a small market

And what do you know about SCSI then, please tell me.
Accordig to almost any info you can get on the Falcon, it supports SCSI-II
standard devices. There are three different kinds of SCSI-II, (soon even
more). Numbered 1-3. The Falcon supports the lowest device, SCSI-II (1).

That's it, and that's a fact, wether you like it or not.

If you feel you have any other information, post it if you dare!

>too.

sigh I was hoping that this sort of response wouldn't come for some time.
Alas, it's not to happen.

First, your opinion matters just as much as the next guy. I never said
otherwise - so long as your opinions about other platforms have some sort
of fact to back it up.
Furthermore, a "well informed debater" is one who is aware of both sides of
a given argument. I am, having used both Ataris and Apples for several
years. However, you miss the point of my post (which I had clearly
entered near the very beginning). The point of my post was NOT to prolong
or enforce the "Atari vs Apple" debate. It was simply to provide factual
information to the Atari advocates who were being told erroneous
information. Period.

Not meaning to flame you or be harsh to you, but I really think that if
you had read the intro to my posting a little more thoroughly and with a
bit of a more open mind, you would have understood the point of it and
wouldn't have posted this rather hostile sounding message.

Well down here in Oz ....

Power Mac 6100/60
8 Meg Ram, 160 Meg HD
No CD, Ethernet built in.
AUS$3995

Power Mac 7100/66
8 Meg Ram, 250 Meg HD
CD, Ethernet built in.
AUS$5795

PowerMac 8100/80
(Quoted as 'unsurpassed by any other computer' - heh heh)
16 Meg Ram, 500 Meg HD
CD, Ethernet built In. AV (microphone / video camera in monitor)
$10695

(Ha Ha Ha. I can see it's really a 'HOME' computer ....)

Mac LC 475
4 Meg Ram, 80 Meg HD
Color Plus Monitor, Extended Keyboard, Claris Works 2.0
$2395

AUS$ = US$0.70

Now will you shuddup Sinclap!?

(And will someone tell me how to add sinclap to my killfile!? PLEASE!?)

Karl.

Many of my points are not true? Such as what?

I understand your position, but I think you're still missing the point of my original post. If this newsgroup were comp.sys.mac.advocacy and people were posting inaccurate information about the Atari there, I would likely respond with a similar post to clear up those misconceptions. The ultimate goal of my original post was to correct the many innacuracies that many Atari advocates were posting as fact.

Why is it that it's always the ones who have switched platforms that feel that they are the 'enlightened ones'? They seem to assume that since we Atari fanatics feel that our Atari's are superior that we are just ignorant and somehow ignore all of the 'wonders' of the other computer. Well, I have to break it to you, but some of us are Atari fanatics because we HAVE used all of the other platforms. Some of us know as much about the other computers as the system programmers, and that's the reason we stick to our Ataris. I for one like to program my Atari and I have found the Atari's operating system much more programmer friendly than the others. You can't say the others are more user-friendly, because user-friendly is a function of the application; you could write a user friendly program for Windows just as well as for GEM, but the programmer is limited by how easy the OS makes it for him. One will simply be easier to program than the other. Some of us also realize that Microsoft Word is a lot nicer than Atari Works, but then, despite what you have said, Calamus SL is unbeatable if you know how to use it and are doing large scale productions (Like books and magazines), Cubase Audio is less expensive to run, MIDI software is available in large quantities at low priced with loads of capabilities, and I could go on with all the numerous vertical apps that are wonderful to use on Ataris, that just aren't up to par on other platforms.

this quite clearly means you thought you cannot buy a 68040 for a Falcon!
(unless you speak a different version of english to me ;-))

:> What are the prices for these wonderful things by the way? Does the OS
:>deal with the 68040 correctly so you can run multitasking programs with
:>memory protection? Copyback problems?

The prices are reasonable, about 600-800 pounds.
(All the accelerators allow FASTRAM with proper burst mode unlike the Amiga)
The OS deals with the 68040, and (unlike the Amiga) MultiTos gives you full
memory protection.

>Stefan Boberg, Amiga/SEGA/CD32 programmer - Team 17 Software / LhA Devel.

For someone who slags down Falcons so much, you seem to be asking some pretty
basic questions, you may know the Amiga h/ware but you know Sweet F.A about
the Falcon.

Your English must be different. I understood Stefan. They are talking
stock configuration. Can you get a 68040 Falcon stock? Gee, I guess
only Atari advocates can be vague it seems everybody else has to be concise
and exact in what they talk about. Something that Rickard should learn.

Yeah, but the 68040 has a completely different MMU. So the question was:
does MP work with the 68040?

AH ah ah... Nope. Sorry to jump in, but most of the Amiga's '040 accelerators
do allow burst mode access, thanks.

It's the A4000 that doesn't allow it in the *standard configuration*.

BTW, the 68040 boards for the A500, A2000, A3000 have burst mode, etc.
It's just the A4000 doesn't do burst mode.

Are you sure that MultiTos works fine with the 68040? I wouldn't have
though that Atari would have the time to test that the 68040 worked.

I know lots of systems with MP died on the 68040. AT&T Sys V, release
3, 4.2, etc had to get fixed for the 68040. My NCR 32/650's operating
system, AT&T, Sys V, R3.0.2 dies horribly on a NCR 32/750 (040).

Amix, Amiga's AT&T Sys V, r4.2 dies on a 68040. Works fine on a 68030.
AmigaDOS 3.0/3.1 have a 68040.library patch.

Do you have a 68040 powered falcon?

- Bill

1903. Atari United! Conference on Free-Net TONIGHT (Sunday)

Newsgroup: comp.sys.atari.advocacy
Date: 1994-04-17 18:07:43 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <2orttg$k2i@usenet.INS.CWRU.Edu>
Source record: 17554
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.atari.advocacy,rec.games.video.atari,alt.games.lynx

On Sunday, April 14, 1994 at 8pm Eastern Daylight Savings Time, the
Cleveland Free-net will be sponsoring a live Atari Conference on Free-net's
local chat system (the IRC). This sunday our special guest will be
Patti Barbierno. Patti is the co-founder and public relations person
for Atari United!, a national Atari Users Group.

All Atari users are welcome and encouraged to attend this meeting.

The meeting's format:

>From 8pm until 9pm the meeting will be a semi-closed forum consiting
of a question and answer session with Patti. Only myself, Patti, and
any auxiliary operators will be able to send text on the channel...

However, users will be able to ask questions by sending a private
message to myself...I will then forward the questions to Patti at the
appropriate time.

Send any questions to me at aa338@po.cwru.edu.

I will have details on using the chat system and our conference in
the general bulletin board of the Atari SIG ASAP.

To get to the general board type 'Go Atari' at the "Your choice ==>"
prompt. Next enter '4' to get to the general bulletin board.
Finally, look for the post towards the bottom of the list called
'IRC Crash Course'. You may need to hit '+' a few times inorder to page
down the list of bulletins.

In the meantime, the conference will be held on channel #Atari

Once again the date for this event is Sunday April 17, 1994 (that's
this next sunday)...

Time: 8pm EDT

At least during the formal part (the Q&A with Patti)
I'm going to have the channel set up so only operators (our guests, myself,
and an auxiliary operator) able to chat on the channel...

You will be able to ask questions, however...they will submit their
questions to me by typing

/msg ATARI_SIG ask (their question)

This question is placed on a queue...

What's more, users can view these questions (view the queue) by sending me this command

/msg ATARI_SIG View

This not only let's them know how long "the line is", but it helps prevent people from asking the same question...

---
telnet freenet-in-{a,b,c}.cwru.edu (129.22.8.32 or 129.22.8.51)

Just a little more information on the conference:

The conference is being held in Cleveland Free-net's local IRC, not the world-wide IRC. One needs a registered Free-Net ID to use this system.

Not yet registered on the Free-net? Register today and not miss a single conference in the future! See the April CAIN newsletter for further information on upcoming conferences...

But how come in the developer's list posted in the Jaguar mailing
list Team 17 is listed?:

----8x CUT HERE 8x-----

Following are the developers. I have a list of many games under
development, but they are direct from AEO and I haven't asked
Travis' permission to reprint it (Travis, you still here?).

Jaguar Developers as of 3/10: (87 total):

(ASG) All Systems Go
21st Century software
3D Games
Accent Media Productions
Accolade Inc.
Activision
All Systems Go
Anco Software
.
.
.
.
.
Silmarils
Software Creations
Team 17 Software Ltd.
^^^^^^^^^^^^^^^^^^^^^^
Team Infinity
Technation Digital World
Techtonics
.

.
-----8x CUT HERE 8x-----

So someone's lying... and I don't think it is Stefan.

I think this is the longest and most diversivied single paragraph I've ever
come across. :)

Many of your questions were answered by a statement you made early on, or
more appropriately, a word you posted: "fanatic." According to my
dictionary, a "fanatic" is "a person marked or motivated by an extreme,
unreasoning enthusiasm." Please note the word "unreasoning" in that
definition. I consider myself to be an Apple/Mac Advocate, and an Atari
Enthusiast. *BIG* difference. In no way could I be a "fanatic" about
either platform simply because unreasonability isn't in my profile.

Furthermore, I don't consider myself to be "enlightened" just because
I've switched platforms. I've used dozens of platforms over the years
including Ataris, Commodores, Macs and other (lesser-remembered) ones. I
believe I have a pretty well-rounded picture of what was and is out there
today, and in that respect I'm fairly qualified to say that, after long
deliberation, I came to the conclusion that the Mac platform is (IMO)
the best choice for what I want in a computer. That's my enlightenment.

Interesting note...You claim that user-friendliness is a function of the
application, not the computer. I beg to differ. User-friendliness is a
combination of a wide assortment of factors *including* the computer as
well as its OS and whatever applications are running on it. I once, for
example, attempted to hook up a hard drive to my ST. After spending about

half an hour fiddling with connectors and the like I was told that I needed to puchase a controller for the hard drive. (This was years ago, when I was an ST beginner.) Nowhere was this mentioned in the computer's documentation, the hard drive's documentation or any README files. Once the controller was purchased and installed it took another two hours or so of setting jumpers and running the formatting software before it would work.

In comparison, to set up a Mac hard drive is simple. Set the SCSI ID number and check for proper termination (as you'd do on any SCSI network), plug the drive into the Mac, power up the drive, and turn on the Mac. The drive comes preformatted (in 99.9% of the cases) and ready to go.

So what did software have to do with the friendliness of that computer? Answer: None. User friendliness, or lack thereof, is a concept involving the intire system as a whole, not just a pretty interface or what have you. Sure, it's possible to have a really bad interface on top of an otherwise great machine - that'll destroy the user-friendliess for THAT program but NOT for the whole machine. It's also possible to have a great user interface on an otherwise poor machine. Does that one well-interfaced program make the whole machine friendly?

Another comment: "Calamus SL is unbeatable if you know how to use it..." To that I say, plain and simple, bullsh*t. Calamus is a decent single-user, small-to-medium sized project publishing program and nothing more. Calamus, in case you haven't noticed, *is* beatable. Otherwise it probably would have been ported to other machines, such as the Mac and PC where it would have flourished. IF it were unbeatable. I do know how to use Calamus. I've used it. It's hardly professional-level stuff. Calamus IS beatable because it HAS been beaten. Just look at what people are buying.

I don't know where this line came from...
>...Cubase Audio is less expensive to run,
>MIDI software is available in large quantities at low priced with loads of
>capabilities, and I could go on with all the numerous vertical apps that are
>wonderful to use on Ataris, that just aren't up to par on other platforms.
...but I think I see what you're getting at. Atari had a head start in the music industry so it's logical that there would be better Atari stuff in that field, just like there's better DTP stuff on the Mac than any other platform because the Mac "pioneered" DTP. However, on a professional level (I can provide proof; my girlfriend is an audio engineer working in a professional studio in NYC), PCs and (mostly) Macs have taken over. Where my girlfriend works...There's three studios that each have at least one Mac in it, plus all of the writers and most of the other engineers work with Macs either at home or in their office (and most of the time, both places). This studio has produced work for AT&T, Shell Oil, Kraft Foods, and countless other award-winning pieces. Not an ST in sight. I'm not saying that *NO* Ataris exist in this field; I'm saying that in this studio and several others that I've been in (I've been in many), STs are practically nonexistant.

(Please don't let this turn into a bash-fest...)

>machines are worthless, and then after he gets suitably flamed into the ground
>comes back with this "moral high ground" post. I have only one word for him:
>hypocrite.
> ~Chris

Whoawhoawhoa...Chris, you know, I've had just about enough of your twelve year old antics.

Let's get some facts up on your screen, shall we? You seem to dislike relating to facts, I realize, but bear with me. First, I *never* said anything along the lines of Ataris being worthless. Extract a quote from one of my messages that says this. You won't find it.

Second, I don't recall ever being "flamed" for anything I had posted. I was involved with the origin of this thread in other messages (i.e., sinclap) and, frankly, I got tired of correcting your continuously false Mac allegations. That's what spawned my original "Apple vs Atari" post which, up until you showed up in the thread, was proceeding in a rather intelligent and dignified conversation. If intelligence and dignity puts me on "moral high ground" then perhaps you should take a step back and think about it for a moment.

Hypocrite? How so? Because I'm not blindly screaming "Atari! Atari! Atari!" like you? Because I'm not willing to brush off all machines that don't have a Fuji symbol on it *just because* they don't have a Fuji symbol on it? Because I stop to think about where the company I'm investing in is going to go in the future *befure* I plunk down my money? Because I have an interest in letting people know proovable fact rather than "I told you so" accusations?

Chris, please, I ask you this as a favor. For the sake of the other people who are currently involved in this thread, *PLEASE* stay out of this thread *unless* you can handle it intelligently, logically, rationally and with an interest of maybe learning something new. Of the several posts I've seen you make in other threads I sincerely doubt this is possible, but anything can happen, I guess. This isn't an attack or an insult or a flame so don't take it like that. All I'm asking you to do is maybe grow up a little. There's enough hostility in the world; nobody needs screaming children on top of it. Capiche?

I think I should make a macro out of the following snippet:
"You obviously haven't been following and/or reading all of the posts I
have made in this newsgroup. Or if you have, you're just ignoring them."

I have no need to "justify" my purchase; my presence here serves two
purposes. First, to hear about new developments in Atari that I haven't
heard before. (Newsflash...I own several Ataris as well as my Mac.)
Second, to correct the many instances of erroneous Mac information that
I've discovered invariably rears its head here.

Justify my purchase. Heh. That's funny. Okay, let's play Justify My Purchase.

I've got $1100 US. I can buy a 25Mhz 040-based Mac with 8-MB RAM, 120-MB
hard drive, keyboard, mouse, monitor, 360dpi inkjet printer, high speed
modem, integrated software and the knowledge and security that Apple and
the Mac will exist for several years to come and will be supported by
hundreds of major vendors. Oh yes...I'll be coming home with some extra
cash in my pocket, too.

Or I can buy a Falcon (68030; 25Mhz?) with 4-MB RAM (?) and an 80-MB hard
drive, keyboard (of course), and a mouse. There is every likelihood that
Atari will not manufacture computers five years from now, given recent
sales records. No major vendors (aside from a few game companies) support
the Atari. I'll also have to stop at an ATM machine to get money so I can
put gas in my car; the going price for the above-listed Falcon at the
closest Atari store to me is $1099.

Assuming you *needed* a computer, and you *needed* to pay the rent and
run major software and had a Significant Other who looked at every
purchase you made with a skeptical eye, which computer would you have a
more difficult time "justifying"? :)

>So? What's your point? It's nice that Apple first did so and so, and that
>so and so invented peanut butter, blah blah... Who cares? What has Apple
>done lately? If you're so happy about the Mac, why post here?

sigh Is there something I'm missing in this room? It seems like every time I answer someone's reply, I'm saying the same thing I said in the first place!

"What color is the sky?"
"Blue."
"Okay, but...The sky is what color?"
"Blue."
"What color is it?"
{ad nauseum}

IF you had read the entire thread (you didn't), and IF you had read my-ntire reply (you didn't), I wouldn't have to post this and the group would get that much less traffic. Let's work towards that, shall we?

The subject (that you missed) was innovations. I believe the key phrase in the original message was something along the lines of, "Apple hasn't done anything innovative." As far as my happiness goes, if you read any of the original threads (you haven't) you'd know why I'm posting here. In fact, I think I just responded to *ANOTHER* instance of you asking me that same question a few minutes ago.

What has Apple done lately? *shrug* Well, you asked. They had a hand in designing the PowerPC chip and surrounding architecture. They were the first company to have full video capabilities built into their machine. They were the first company to have full telephony functions built into their machine. First major computer vendor to market an ergonomic keyboard. First major vendor to include energy saving features into their hardware. First (and, so far, only) company to announce PowerPC upgrades for existing machines. First company to bring speech recognition to the desktop, and have it actually WORK, *and* have it built into their machine (good synthesis, too, but hardly a first). Best implementation of handwriting recognition in a device that won't cost you your house. First mass-marketed device that communicates with computers (and other devices) via an infrared network connection - and that doesn't cost the house. First (but lame, admittedly) computer to market itself as a central entertainment center, complete with television.

Hey, you asked.

We are in the developer list. We don't have the hardware. Hence, they
lied to you.

However, we will eventually get some development systems, and I will
probably do something for it this fall (either that or the Sega Saturn).

>this quite clearly means you thought you cannot buy a 68040 for a Falcon!
>(unless you speak a different version of english to me ;-))

I meant that you cannot get a 68040 Falcon. You have to buy a 030 falcon
and fit it with a 68040 accelerator from some basement company. Granted,
what I wrote was rather ambigous, but then English is only my second or
third language (depending on how you look on things :).

>:> What are the prices for these wonderful things by the way? Does the OS
>:>deal with the 68040 correctly so you can run multitasking programs with

>The prices are reasonable, about 600-800 pounds.
>(All the accelerators allow FASTRAM with proper burst mode unlike the Amiga)

There are CPU boards with burst mode if you want it. I don't miss it; my
A4000/040 is over three times as fast as a 25MHz 68030 A3000 as it is.

>The OS deals with the 68040, and (unlike the Amiga) MultiTos gives you full

>the Falcon.

Spot on. I haven't even seen a Falcon. I'm sure it's a nice machine for
those who want that sort of thing, and I'm not really bashing the machine
as such. It's more like I get so fucking annoyed with Rickard's overzealous
one-way mind that I have to oppose to his rantings. In his world Atari is
god and anyone who dare to say something negative about anything Atari is an
imbecile. What he should realize is that no machine is best for everyone
and everything.

Yeah right. I itemized your FOUR attempts at flaming and insulting me. Get a clue, okay? Maybe you should read your own post... You have absolutely ZERO credibility. maybe you fear the word hypocrite because it hits so close to the truth, eh?

How about this for rationality: I have used the two biggest platforms extensively, Mac more than Windows (for now) and still find Atari to be the best choice for my uses, which is basic Word processing, graphics, music & telecommunications. Fairly average consumer stuff. I have NEVER had an extensive problem since my first ST in 87 had a heat problem (fixed right away) Never had trouble hooking up peripherals, never even had a hard disk crash, okay? I like them, but do you see me going over to the mac groups and posting what slime thety all are for buying a Macintrash? No, I don't. I could care less what mac people think about their computers EXCEPT when they come here and try to preach to me. I'm tired of you, I'm tired of SInclap, I'm tired of all the people who seem to have no desire to be here other than to start trouble. But I won't shut up, because I know that people like you believe in the "last word" righteousness, so I fight you on that level. And I will until _you_ give up and learn that your opinions are not applicable to everyone. Understand?

Good point. Until the TT and MegaSTe, connecting a hard drive to an ST wasn't the easiest thing in the world. Of course, it's STILL better than installing on into an IBM compatible.

I am not the expert on Calamus or DTP for that matter, but I have tinkered with a few of them. The user interface on Calamus SL takes a bit of getting used to due to it's European iconic design, but once you're beyond that, it's quite a pleasure to use. I am the technical editor of a magazine that uses Calamus SL to publish a magazine, among other things, and I can tell you that it's NOT a small project. It hasn't been ported to other machines, because according to the developers, the others were "underpowered." That is to say, the Atari TT is fast enough to make Calamus SL run well, and the machine doesn't get in the way of the application like other computers and OS's do. The only machine that it's been ported to is the Dec Alpha. Not being the expert on Calamus, I cannot go further, but my publisher can, and I'll get him to write a reply to your statement.

NOW, the ST is not very prominant in the music market, but there was a time when Fleetwood Mac, the Beach Boys, and Madonna used them for sequencing. As far as I know Fleetwood Mac (Mack? <shrug>) still uses Atari's, but I don't know about the others. One of the writers in Processor Direct magazine just recently published an album that he created on his Atari.

>applicable to everyone. Understand?

The only thing I wholly understand about you is that you have an
incapacity to differentiate between a logical conversational thread and a
flame fest. My intention here was NEVER to start trouble; I made that

perfectly clear from the outset. My intention here is (and always has been) to provide accurate information. For some reason you can't seem to accept that. I've given up, long ago, trying to convince you that this is my sole intention. It seems to me that you think you've got me all figured out and you won't hear another thing about it. Case closed. Just like your mind, if this indeed is the case. Unfortunate, since I think you could have the potential to be a significant contributor to this thread if you didn't simply stand around yelling all the time.

Let's get some more of your false and unprovable accusations out of the way, while we're at it. I never accused anyone of being "slime" for buying an Atari. I never even implied it. I also never expected my opinions to applicable to everyone, nor did I ever intend them to be so. I *do* expect (wrongly, perhaps?) people to understand the difference between provable fact (i.e., stereo sound on Mac II) and unprovable heresay.

There is no "last word righteousness" here, Chris. Really, there isn't, and if you took half a step back, breathed in deeply, and (with an open mind) read the words that I write you might see this. Every reply I've handed to you is an information source. Period. You ask me a question, I answer it. (Unlike you; see initial commentary.) You make a false and/or unsubstantiated accusation, I correct it. If you stoped posting incorrect information, I wouldn't respond. Simple.

Here's the Bottom Line, Chris. It's what I've been saying since my first post and, hopefully, you'll be able to understand this.
* First, if you love your Atari, fine. More power to you. I'm not going to look on you any differently than I do now just because of your computer choice, and I'm not going to try to brow-beat you into thinking that the Atari sucks. Never have, never will.
* Second, it's *always* been my opinion that if your computer does what you want it to do, then that's the right computer for you. I've said this countless times, yet you constantly accuse me of putting down Atari users. Why? Can you, in fact, find one single quote from me that puts down an Atari user *just because* he (or she) owns an Atari?
* Third, I again ask you that if you want to be in this thread to please have some consideration for the topic at hand. So far, you haven't shown any, but instead spent your time in unfounded accusations towards me.

I'm not like Sinclap. I don't have an "anti-Atari" signature file. I'm NOT anti-Atari. I'm pro-information and pro-fact, period. I don't go wandering around calling people names and making false accusations, making up things as I go along. I expect the same consideration and understanding from you and everyone else. Is that too much to ask?

1919. Private little war... :)

>many, many people who understand what I'm posting about. Those same
>people who have been filling my mailbox on a near-daily basis, continuing
>one of the more stimulating conversations I've had in months. :)

Wow. Sinclap says the same thing. I'd hate to think what stimulates you...
Hey everybody, Thanatos has a glee club! Oh boy, so does Barney.
Quote where I have been "preaching the word of Atari" okay? I do nothing
but respond to innacurate posts such as yours.

>The only thing I wholly understand about you is that you have an
>incapacity to differentiate between a logical conversational thread and a
>flame fest. My intention here was NEVER to start trouble; I made that

Ooh. you are so astute. Why not read what I said?

>perfectly clear from the outset. My intention here is (and always has

Yeah, you say you don't intend to start a flame-fest, then proceed to flame
away. Must I say the "H" word again???

>been) to provide accurate information. For some reason you can't seem to
>accept that. I've given up, long ago, trying to convince you that this is

I don't accept lies.

>my sole intention. It seems to me that you think you've got me all
>figured out and you won't hear another thing about it. Case closed. Just
>like your mind, if this indeed is the case. Unfortunate, since I think
>you could have the potential to be a significant contributor to this

I'll stop debating you when you stop posting drivel and lies and hypocritical
statements.

>Let's get some more of your false and unprovable accusations out of the
>way, while we're at it. I never accused anyone of being "slime" for
>buying an Atari. I never even implied it. I also never expected my
>opinions to applicable to everyone, nor did I ever intend them to be so.

Unproveable only because you change your story every five minutes... Do you
honestly think we have THAT short an attention span?

>I *do* expect (wrongly, perhaps?) people to understand the difference
>between provable fact (i.e., stereo sound on Mac II) and unprovable heresay.

Then prove it. Mail me that manual. posting quotes does not count as that
can be forged. Look it says right here in this Mac manual "Hey fool! we
duped you, you should have bought an atari! hahahahah!" See how credible
that is?

>There is no "last word righteousness" here, Chris. Really, there isn't,
>and if you took half a step back, breathed in deeply, and (with an open
>mind) read the words that I write you might see this. Every reply I've

Right on, Chris!
I don't understand why so many Mac bigots feel that it is necessary to
get on ATARI.advocacy just to advocate the use of MACINTOSHes. That is

___***NOT***___ what this group is for.
Why don't ALL of you MAC bigots go fuck off and die (at least in this group?) Take your trash somewhere else.
I read this because I have some interest in Atari.
You assholes read this because you hate Atari.
That is just plain STUPID.

FUCK YOU. GO HOME. Go ahead. Flame me. Get on MAC.ADVOCACY and post about what an asshole I am because I DON'T CARE WHAT YOU THINK.

MAC bigots, listen up: Only a moron, baby, or a fool would post to ATARI.ADVOCACY to say that people shouldn't want an Atari.

You have such an inflated ego that you call yourself "Lord Thantos" but you are really a >BRAT<. You tell an Atari advocate not to post here. GROW UP, ASSHOLE!

Before you flame me for being computer illiterate, you should know that I have been in the computer business since 1970, and I have been working with microprocessor-based systems since 1976. The Apple I (that's I, not II) came out a few months after I bought my first CPU, and there were times when I thought I might have been better off if I had waited.
No matter. As Chris said, just because >YOU< don't like Atari is no reason why others shouldn't enjoy them.

>to write a reply to your statement.

"Underpowered"? Please. Sounds like a cop-out to me. How can, for
example, an 040-based Mac, 486-based PC or RISC-based workstation (i.e.,
Sun) be "underpowered" for a program like Calamus?
Calamus, IM(professional)O, is a good program for small to medium sized
projects - flyers, menus, school reports, brochures, multi-page
newsletters (not exceeding about 16 pages), etc. It could be considered
nearly perfect for the "at home" desktop artist who does the occasional
freelance project. But as far as professional-level quality and
performance goes, Calamus has a LOT of catching up to do.

>NOW, the ST is not very prominant in the music market, but there was a time

I remember that time. Don't forget Tangerine Dream with their on-album
credit to the ST for production. I *think* Madonna still uses them for
preproduction; I remember reading that somewhere recently. I also
acknolwedge Atari's firsts in the area of music; first machine with
built-in MIDI, first computer to be represented at the North American
Musician's Fair (and other music-related shows), etc. Heck, when the ST
was my primary machine I had two keyboards connected to it! :)

>No, no, no. Your statements are far from bashes, and I'm enjoying this
>debate. There will be no bashing.

Thank you SO much. It's very refreshing to have conversations like this. :)

1930. need help w/ Cumana OSK v2.3 for Atari-ST plz?

Newsgroup: comp.sys.atari.advocacy

Source record: 17581

Sorry to bother y'all again. I'm still trying to get my OSK v2.3 from Cumana (Atari-ST) talking to my SCSI drives. They're connected to ICD's host adaptor as SCSI IDs #0 & #2. They work 100% just fine with Atari TOS/GEM and ICD's drivers (v6.2.3 currently). But OSK gives me "Not Ready" errors on some files esp. big/large ones. And OSK doesn't like to do a "physical" format. But the STHD driver from Cumana (Reccoware) *can* see the drives and report their correct SCSI info (via FORMAT and FREE) -- honest.

When I posted this plea for help a couple of months ago, one person in Germany suggested I patch STFD (not STHD?) at offset $8E0 to make it $20 or more. Without any further details than that, I didn't do this (for obvious reasons!). So here's the IDENTs on these two modules as delivered by Cumana:

```
Header for: stfd
Module size: $CC6 #3270
Owner: 0.1
Module CRC: $A3FDB2 Good CRC
Header parity: $1E39 Good parity
Edition: $15 #21
Ty/La At/Rev $E01 $A001
Permission: $555 -----e-r-e-r-e-r
Dev Drv, 68000 obj, Sharable, System State Process
```

```
Header for: sthd
Module size: $A9C #2716
Owner: 0.1
Module CRC: $C45E91 Good CRC
Header parity: $1E46 Good parity
Edition: $1F #31
Ty/La At/Rev $E01 $A000
Permission: $555 -----e-r-e-r-e-r
Dev Drv, 68000 obj, Sharable, System State Process
```

Another person (from France) thought I should get ICD's latest adaptor. I don't see why because the one I have can honor the SCSI commands just fine. And/or I should get OSK v2.4 -- talk about money I don't have!

Then Cumana told me they'll do some more testing -- I haven't heard back from them at all for 2 months almost. (I've stopped calling/faxing them since my phone bill grew to over $140 one month -- effectively doubling the price of this package!)

I don't see why I'm having so much trouble getting help! The two drives are a Seagate ST277N and a CDC 96-meg, and both are very reliable and quite fast for my purposes (never big enough, though, ya know). ICD's partitioning software can even make the part'n info AHDI-compatible. And.. it all *almost* works with OSK.

-*-

I'm also still inquiring on how to buy G- or K-Windows for this Cumana flavor of OSK. V2.3's "console" driver does support a Get/SetStat call to deliver the address of the screen memory, so I'd think we'd be able to run a window/gfx package. (Sadly that's all I know about the technical details -- Cumana only sent me Microware's v2.1 tech docs, not v2.3 or any Atari-specific tech docs.)

I'm about to give up, folks. I'm already hugely miffed how the CoCo/L2 support has withered. Those of you who know me, I want to write some MIDI packages (and you know why :) but I need gfx & windows! If there's no GW/KW for Cumana, just say so! I'll ask Cumana to give me my money back and you'll never hear from me again! This is getting way too expensive for a home hobbyist!

-*-

Thanks for putting up with me again. Please send me e-mail if you've got any clues I could try. I'll certainly appreciate it.

. -- thx, Paul Seniura (from Oklahoma City)

1931. MARKET SURVEY

Newsgroup: comp.sys.atari.advocacy
Date: 1994-04-20 03:49:45 UTC
From: sngmedia@world.std.com
Message-ID: <CoJHAz.Byq@world.std.com>
Source record: 17437

We are a small, dedicated group of people desperately trying to get a video production company off the ground.

Recently, we secured enough financial backing to produce several videos on the subject of personal computing.

Because we don't have the financial resources to perform a traditional market analysis, we considered several alternatives and concluded that we should consult the people of the Internet, who are technically proficient and tend to be enthusiastic personal computer users.

We would like you to indicate which three of the below described videos would appeal to you most.

Please note that each video synopsis is numbered. When you are ready to send your response, please specify the numbers corresponding to your three video selections, and use commas to separate the numbers.

For example, if you choose selections four, eight, and eleven, the body of your letter would simply be:

4,8,11

and nothing more.

When you send back your response, please specify "MARKET SURVEY" in the subject field. Then, direct your response back to sngmedia@world.std.com.

Please realize that this is not an advertisement, or solicitation. We simply would like to know your response. You will not be contacted further.

Thank you in advance for your help and cooperation.

Tom and Randi Fecker
sngmedia@world.std.com.

Please select three videos that interest you most:

1. The Internet Pilot's Guide
A plain English guide to getting around on the Internet by veteran users. How to use Internet resources to send/receive e-mail, and to search for documents and files relating to a particular subject. How to use LISTSERVs, GOPHER, ARCHIE, WWW and WAIS. How to use FTP and Telnet to access remote computers for file transfers, remote

logins, etc. Also, learning how to observe Internet's "netiquette." And how to access multimedia Mosaic bulletin boards.

2. How to Make Money at Home With Your PC I -- Successful PC-Based Businesses
Meet five successful entrepreneurs who started their own home-based businesses using a PC. Includes businesses that provide typing services, mailing list management, horoscopes, bookkeeping, and even a software developer who does not know how to program -- he hires other people to implement his software designs. Includes ideas for two dozen home-based businesses you can start using your PC.

3. How to Make Money at Home With Your PC II: Portfolio Management.
Whether you manage your own portfolio for investment gains, or you take on clients for a consulting fee, a PC can give you powerful tools for portfolio management. Meet three successful home-based portfolio managers who use their PCs to maximize profits. They'll inspire you, and share some tricks of the trade that can help you land clients and get started. We'll also show you how to determine which software applications will meet your needs, and which online services will satisfy your requirements.

4. How to Make Money at Home With Your PC III: Telecommuting
Learn how to use your PC to telecommute to companies across America that are looking for specialized consultants with skills like bookkeeping, software design and programming, editorial and script writing, technical proofreading, graphic design, copywriting, and more. Includes interviews with three successful telecommuters who use their PCs, faxes, modems and phones to serve distant clients, and information about a telecommuting referral service that could help you find employers.

5. How to Upgrade Your Hard Drive, Step-By-Step
From choosing your new hard drive, through ordering, installing and testing it. This plain English video shows you how to do the job correctly, one simple step at a time. Using industry-wide standards, we'll show you what all hard drives have in common. Includes how to determine if your controller will support a particular hard drive. How to remove the old drive, and install, format and test the new drive. Includes a discussion on the differences between the various standards.

6. How to Design Your Own PC
You don't have to be an engineer to design and build the PC of your dreams. This plain English video shows you how to figure out the PC design that is best for you, how to specify components, how to make sure they'll work together, and where to buy them. You'll end up with a top quality system that will save you money.

7. How to Build Your Own PC
Once you've designed your PC, we'll show you how to build it. The

actual process will take you only a few hours. Using an easy-to-understand method, we'll show you how to inspect, install and test components. Includes tips and tricks from computer production experts. The technical skills can be easily mastered by almost anyone, and you probably already own most of the tools you would need.

8. How to Increase Your Computer's Memory

This plain English video shows you how to determine whether your computer memory can be increased, and how to do the job correctly, one step at a time. You'll learn about industry-wide standards for memory, how to configure additional RAM and cache, how and where to buy RAM chips, and three ways to eliminate low-quality RAM chips. Covers all phases of the process from opening your computer, to testing your memory. Includes discussions on how to ensure your DOS set-up is able to access all available memory, and how to use various memory management software applications.

9. How to Use MS-Windows 3.1

This powerful graphical user interface can help you work smarter and faster, but the manual and the online tutorial that come with Windows leave many questions unanswered. This plain English, step-by-step video will show you how to install Windows on your computer and set it up to get optimum performance.

10. How to Find a Job in the Information Age

A PC can give you an incredible advantage when you're searching for a new job -- or even a new career. But you have to know just how it can help you. In this video, an experienced employment counselor will show you how to tap the power in your PC to find job leads, create a winning resume and customized cover letters, tap into databases and find bulletin boards that will lead you to job openings, and use online services to research potential employers.

11. How to Install a Sound Card in Your Computer

Here's how to add incredible stereo sound to your computer with step-by-step help. In plain English, you'll learn how to determine if your computer can support a sound card, how and where to buy a high-quality sound card. How to open your computer, and install and test the sound card.

12. How to Install a CD-ROM Drive in Your Computer

Using simple tools, this plain English video shows you how to install a CD-ROM Drive in your computer. You'll learn how to make sure your computer can support a CD-ROM drive -- and what to do if it can't. Covers internal vs. external drives, how and where to buy a high quality CD-ROM drive, what you need to know about differing industry standards, preparing the drive bay, testing and trouble-shooting. Covers SCSI and IDE.

13. How to Fix the Most Common Computer Problems

Your computer serviceman may not want you to know this, but all you need is the know-how you'll get from this video, simple tools, and

easily-obtainable diagnostic software -- and you can fix most common problems you'll ever encounter with a PC.

14. What to Do When a Virus Strikes Your Computer
Viruses can come from almost anywhere: a colleague or friend's disks, a network, a bulletin board, even commercial software. If you ignore the first warning signs, a virus can wipe out your data and permanently damage your computer's memory. In plain English, this video will tell you how to scan disks for viruses, how to check downloaded files from bulletin boards, how to set up a virus prevention program for your home or office computer, and how and where to buy the best anti-virus software. We'll also cover the pros and cons of the antivirus software in DOS 6.X and Windows 3.X, how to use antivirus software, and more.

15. How Your PC Works: Inside the Case
Here's a down-to-earth explanation of how your PC actually processes information, and what really goes on inside the case. You'll get a guided tour of the insides of a PC, learn about how the various components work and how they communicate with each other, and get a clear explanation of technical terms. A must for anyone who wants to really understand how to program, use and repair a PC.

16. How to Create Config.Sys, Autoexec.Bat and Batch Files
These basic files can make it much easier to use your computer -- or cause incredible headaches if they are not written properly for your particular software and peripherals. Now you don't have to be at the mercy of murky tech manuals, because we'll show you how to create files that work for your system -- step-by-step, in plain English. You'll learn how to write, modify and test Autoexec.Bat and Config.Sys files; and how to create batch files.

17. How to Add a Modem or Faxmodem to Your Computer
Here's the easy way to add a modem or faxmodem to your computer, with step-by-step guidance from this plain English video. You'll learn how to determine if your computer can support a modem or faxmodem, and what to do if it can't, how to choose and buy the best modem or faxmodem, how to open your computer, and install the modem or faxmodem, how to test it, how to quickly eliminate common problems, and how to set your modem or faxmodem correctly.

18. How to Make Money at Home With Your Computer
The information age is opening up incredible new opportunities for PC owners to make undreamed of money, using skills and knowledge you may already have! Here's inside information on the ten most promising telecommuting jobs and 12 small businesses you can run right from your home, using your PC. Includes profiles of PC owners who are actually running PC-based home businesses.

19. The Super-Highway Roadmap
This is your guide to where to go and what to see. You can make

incredible contacts and gather powerful, valuable information on the Internet, but the problem is that most people can't begin to imagine the potential of something that seems so abstract. This plain English video will introduce you to the Internet, and make these opportunities concrete. Includes interviews with 7 people who did the impossible by gathering information and making contacts on the Internet.

20. How to Upgrade and Repair Your PC I: Basic
This is the video your repairman doesn't want you to know about! Since the components of most PCs are highly modular, PC repair is easier than you think. Just pinpoint the problem component, unplug it, remove a few screws, replace it, and presto! You're in business again. This step-by-step video shows you how to pinpoint problems and replace your PC's components, using ordinary household tools.

21. How to Upgrade and Repair Your PC II: Multimedia
Here's how to save big money on a PC with all the latest multimedia peripherals. You learn how to determine if your PC can be upgraded, how to upgrade your video card and bus, and how to add a CD-ROM drive, sound card, video accelerator, and more. Presented in plain English. The procedures you'll learn require ordinary household tools -- nothing fancy!

22. Plain English Guide to DOS 6+.
The powerful sub-programs buried deep within DOS 6.0 and higher can help you work smarter and faster, but the manual and the online tutorial that come with DOS leave many questions unanswered. This plain English, step-by-step video will show you how to install DOS on your computer and set it up to get optimum performance. In addition to DOS commands, you'll learn how to use the shell, defragmentation, scan and antivirus programs that come with DOS.

23. Home Financial Management on a PC.
Your computer can help you create and manage a budget, keep track of your credit card accounts, handle your tax deductions, and reconcile your bank accounts. But that's not all! You can also determine whether you should pay down your mortgage, finance a new car or pay cash, buy or rent your home, and how much you'll need for retirement. The financial information your computer can give you might mean the difference between just getting by and a very comfortable lifestyle -- if you ask the right questions and use your PC to develop a financial strategy.

24. The Online Bulletin Board Guide
Bulletin boards can be the on-ramps to the Information Super Highway -- if you know how to access and use them. This step-by-step guide shows you how to find bulletin boards, set-up your modem, log on, find out what they have to offer, find bulletin board users who share your interests, search for information, and upload and download files.

Thank you.

Interesting, the next atari dateline on Genie (May 6) I'll pose this
question to Bob Brodie to get the straight answer. I do know that back in
March, he or someone said that the only developers on the list were those
with the system. I guess we will find out who's lying then.

Oh, yeah right. Well, Rickard, I love the Jaguar and all but I am realisic. What's up with you? Your "ATARI rules" in Sweden myth has been defeated by Stefan... You think the Falcon is doing so good when ATARI in an economic public statement basically said they are switching from computer manufacturing to video game console manufacturing, etc. Any comments?

|>
|> RH> So someone's lying... and I don't think it is Stefan.
|>
|> Didn't he say they had ordered the hardware but not gotten it yet? That would

No, he said they will eventually get development systems. He also mentioned *clearly* they are on the $299 deal. I quote:

>SB> Of which maybe 30 don't have development systems, but have signed up
>SB> just to review the reference manuals. We are among those.

So, again... someone's lying... and I don't think it is Stefan.

By all means do so. Don't be surprised by the answer to who's lying,
but anyway here's my prediction:

Atari changed their mind. Which is natural, people change, companies
change and if ATARI wouldn't have changed a bit, I woulnd't have hope
for the Jaguar.

1942. The Falcon030 and SCSI-II

Newsgroup: comp.sys.atari.advocacy

>
> Kim, I am talking about the speed and some things posted here
>by other ATARI people a while ago (actually in comp.sys.atari.st :-))
>

Ricardo,

From my understanding, the Falcon030 does have a _true_ SCSI-II port. The confusion comes from people who don't really understand what SCSI-II means.

In the beginning there was SCSI-I. But it was a very loose standard. It was too easy for companies to produce variants of that standard so that there were lots of incompatibilities between peripherals. For example, SCSI-I didn't even specify a standard port so different companies used different ports. This meant that you might have to get different cables to hook a SCSI drive to an Apple, Amiga, PC, or Atari.

Anyway, one of the goals of SCSI-II was to produce a tighter standard. This included specifying a standard port (which the Falcon030 uses) and specifying the various SCSI command codes more explicitly.

Another goal was to improve the performance of SCSI. This included the _optional_ use of something called FAST SCSI (I think this refers to synchronous transfers) and WIDE SCSI (I think this refers to the use of 16 or 32-bit wide cables -- I forget which exactly).

From what I gather, the Falcon030 does not support either of these options. Nevertheless, the Falcon030, by definition, does have a true SCSI-II port.

You said:

I meant that you cannot get a 68040 Falcon. You have to buy a 030 falcon
and fit it with a 68040 accelerator from some basement company. Granted,
what I wrote was rather ambigous, but then English is only my second or
third language (depending on how you look on things :).

Be careful what kinds of comments you make about some of these upgrade
products. Wizztronics is about to release a tremendously good 68040
accelerator for the Falcon, and it is an impressive product. Wizztronics is
FAR from 'some basement company'. They're very hard-working, extremely
knowlegable people, and they know quite well what they're doing. Ever wonder
where Atari gets many of their hardware bug reports from? Wizztronics. I've
been impressed with their company ever since I first talked with them.

I have been paying attention to this volley of debate, and I have noticed a few things. The responces people give to you are defensive, but they directly answer your technical questions and other concerns, and give plenty of useful information. Your messages, on the other hand, started out intelligently, but now, they have reduced to nothing more then self-defense. You are not answering our questions, you are directly contradicting facts that people know the correct answer to, and you are providing no useful information.

>___***NOT***___ what this group is for.

Agreed. However, I'm not advocating the use of Macs. I'm clearing up the errors that several Atari advocates are claiming to be fact.

>Why don't ALL of you MAC bigots go fuck off and die (at least in this
>group?) Take your trash somewhere else.
>I read this because I have some interest in Atari.
>You assholes read this because you hate Atari.
>That is just plain STUPID.

I own several Ataris; how can I hate them? I read this group because I'm interested in the goings-on in AtariLand. When those goings-on involve accusations based on heresay and/or erroneous information, I clear them up. Is providing factual information to correct erroneous information *THAT* bad? (BTW, how can I be a "Mac bigot" if I own and use Ataris as well?)

>FUCK YOU. GO HOME. Go ahead. Flame me. Get on MAC.ADVOCACY and post
>about what an asshole I am because I DON'T CARE WHAT YOU THINK.

No need to flame you. Your own words, I think, clear up any misconceptions people may have about you.

>MAC bigots, listen up: Only a moron, baby, or a fool would post to
>ATARI.ADVOCACY to say that people shouldn't want an Atari.

Agreed again. I never said that people shouldn't want an Atari. If you think I have said that, then show me the words I wrote.

>You have such an inflated ego that you call yourself "Lord Thantos" but
>you are really a >BRAT<. You tell an Atari advocate not to post here.
>GROW UP, ASSHOLE!

Actually, it's "Lord Thanatos," but you can call me Steve or LT, if you prefer.
I *asked* Chris not to post in this thread *IF* he wanted to behave in an irrational and/or unintelligent and/or immature manner, such as the way you yourself are posting. If he (or you, for that matter) wants to contribute in a positive effort - there are several people who are - then I have no problem with him. Or you. Or anyone else.

>Before you flame me for being computer illiterate, you should know that
>I have been in the computer business since 1970, and I have been working

>with microprocessor-based systems since 1976. The Apple I (that's I,
>not II) came out a few months after I bought my first CPU, and there were
>times when I thought I might have been better off if I had waited.
>No matter. As Chris said, just because >YOU< don't like Atari is no
>reason why others shouldn't enjoy them.

Who said I don't like Atari? Certainly not me! Furthermore, I also never
said that nobody else should like them either!
I don't think you're *computer* illiterate, btw.

-Steve

Ah. Thanks for the explanation Gerry. We both meant the same
actually, but technically word-wise speaking you are right.

My point is that most people here (read Rickard) when they talk
about the SCSI-II in the Falcon they expect the speed of the
'average-fast' SCSI-II's. Thanks for the explanation, interesting.

1951. Interview with Bob

Newsgroup: comp.sys.atari.advocacy
Date: 1994-04-21 10:12:37 UTC
From: sys1@exnet.com
Message-ID: <CoLtp3.Hz1@exnet.com>
Source record: 17452

I just read the interview with Bob Gleadow in Atari ST Review. The major feature of the interview are his claims that.

* 80,000 Falcons have been sold across Europe

* A 32 bit databus falcon design exists but is not being produced to concentrate on a known, working design.

* Development of TOS 5 and MultiTos will continue once Jaguar development is back on target

* Production of STes has been an on/off affair. But demand is estimated at 10,000 units across europe. Atari were `premature' in claiming that the ST was dead.

* The Falcon has not been out of production since introduction. The TT has been back in production for 2 months with `several thousand' units being built.

* 1000 Jaguars are being built per day (approx) with a target figure of 5000 per day---estimated sales are between 700,000 and 9000,000.

That aside it was an interesting interview giving hints in to the Atari business plan. From reading between the lines I got a feeling of sound but very cautous planning. There are plenty of hints about what will be done in the future, but details and firm commitments were absent.

If you want to know more go read the mag:).

1952. Re: Power Macs, I`m NOT impressed.

I think that too much emphasis is put on "major vendors" and
market share. I have read posts about the Falcon not being
a success one too many times. As far as I'm concerned it is a
very nice computer which fills my computing needs.... to me
that is a success. The Falcon has the support of more than just
game companies (actually it doesn't have the support of enough
game companies!). Gribnif, ICD, DMC, Compo, Majisoft, Hisoft,
Lexicor, Step Ahead and Codehead, just to name a few, are all
active in the Atari market. True they won't be found advertising
in Byte or MacUser but who cares? They're great companies that
come out with amazing software. A lot of times it seems that
Mac advocates want to argue because they have full color glossy
publications the sun revolves around them.

I'm not answering any questions? On the contrary, I am. When someone asks me one. For the most part I've been subjected to "go home you Mac bigot"-type posts, for which I'm naturally defensive about. In my opinion, many of the messages I've gotten here are *offensive", not defensive.

I will answer any question posed to me about this subject. And any "facts" that I might be contradicting are self-explanitory; the *perception" that the Mac II, for example, doesn't have stereo sound is not a fact, so I contradict it. I've provided, I believe, a great deal of useful information and so do several other people that I've been conversing with here and in my mailbox.

Please point out a question that was poised to me that I didn't answer and I'll be more than happy to answer it.

understanding from you and everyone else. Is that too much to ask?
==========

Hooray!
This is the kind of attitude that is like gold in an area like this!
I've been following the Atari groups for a couple months more or less for professional development (as much as an after[high] school job is a profession) and it seems to me that the kind of thing that possibly an Atari could maybe be cost-effective at is in vertical market things, such as a shop that does exclusively audio work. I have a Mac at home, and work with Ataris in a database environment at work.

We mostly do database and word processing where I work - very bread and butter applications, with a little (ersatz) CAD and DTP. Now, it seems to me that a platform that, in the US at least, doesn't even have any decently supported productivity apps is headed straight to oblivion. Case in point: We are mainly devoid of tech support. We have to use a European database (menus and dialogs in dutch <!>). Networking is a nightmare. However, it all does work, after a fashion. But, it takes an inordinate amount of time to get anything to work, and there are things that we would like to do but cant because the machines are not powerful enough or the software does not exist.

Here is the $64 question:

In today's computing environment, does it make sense to go with Atari in business, and why? The equipment may cost less than the alternative, but it includes things that are not of use (DSP, MIDI) to the business user and the paucity of software and hardware support leads to greater costs in toto than for another platform. I've worked with Ataris in business for 2 years now, and I have come to believe that the same reasons that make them undesireable for business now apply for home users. Especially in business, now a 32 MHz 030 (or 16 MHz) may be barely adequate now, but what about 5 years down the road? Why didn't Atari put in a 20 MHz 68LC040 in instead? Woulda added $150 to the price, but would also have tripled performance...

_IF_ the Mac II series has stereo sound, then tell me why not one piece of software has supported stereo recording or playback? I've worked with several utilities, including SOundEdit Pro, which supports stereo & 16 bit sound with an Audiomedia card, but only 8 bit mono through standard Mac recording and playback? Let's give you for a moment that it has the hardware, then why did the operating system not support it???

Well.......... It seems that the Amiga Assholes (AA's) have invaded the Mac advocacy group so the Mac people had to go somewhere. Before Amiga flames start up, my Amiga Assholes comment should be construed as 'assholes who happen to use amigas'. Their assholery has nothing to do with their choice of computing platform, merely their inappropriate methods of advocacy.

More seriously, the Mac and the Atari are close cousins both in design philosphy and implementation. Please note that Apple's success with the Mac came after they got rid of the engineers (Jobs/Woz) and put a soft drink marketing guy in as head of the company. Atari still hasn't decided whether it wants to be a game company or a computer company. I've loved my ST, I'll use it till it croaks, but it's probably my last Atari.

(BTW, how do you keep the AA's out of here?)

Huh? Where in the quoted message does he say they ordered the hardware.
He says eventually they'll get some development systems, meaning when they
decide to order the hardware. To paraphrase Ricardo: "Someone lied and I
don't think it's Stefan."

|>
|> They have? Where?
|>
|> BTW; Wait a few days, you're on for a BIG surprise.

Oh, thanks. I'll probably will. BTW, there's a report where I took
that:

---------------8x CUT HERE 8x--------------

Atari Loss Widened During 4th period As Sales Fell 67%
By a Wall Street Journal Staff Reporter

Sunnyvale, Calif. - Atari Corp. reported a wider fourth-quarter
loss on a 67% drop in sales and warned that it won 't be profitable
until it cranks up shipments of its new Jaguar video game product.
But the game maker's stock rose 87.5 cents to $7.375 in
American Stock Exchange trading on news that Atari got a
cash infusion from Time Warner Inc., which bought $12.8 million of
Atari stock, boosting its stake to 27% from 25%. Separately, Atari
said rival Nintendo of America Inc. settled a lawsuit alleging
Nintendo had infringed on an Atari patent for horizontal scrolling

in video games. Terms weren't disclosed. Nintendo of America is
a unit of Nintendo Co. of Japan.
Atari's Loss for the quarter was $22.6 million, or 39 cents a
share, after a $12.1 million charge for writing down inventory and
a $6 million restructuring charge. In the year-earlier quarter,
Atari had a loss of $21.9 million, or 39 cents a share. Sales fell
to $8.5 million from $25.5 million.
Analysts said the results were in line with expectations,
given Atari's switch from selling computers in Europe to selling
video games in the U.S. The "implosion on the revenue line was not
unexpected," Gruntal & Co. analyst Charles Lemonides said. He added
that the Time Warner cash infusion "was a big vote of confidence."
In a statement, Atari said it has "substantially completed"
^^
its transition to selling video games. The game maker's future
^^
hinges largely on the success of its full-motion,
^^
graphics-intensive Jaguar games, which are now selling in San
^^
Francisco, New York and Los Angeles. In a statement, the company
^^^
said that because of increased spending to market the games "we do
not expect to achieve profitability" until Jaguar ships in
substantial volume. "

Atari and Nintendo contradicted each other about the outlines
of Friday's patent-infringement settlement. Atari said in a
statement that Nintendo had paid cash to settle and to license
Atari patents. But Nintendo said in its own statement that it
received "certain payments and patent licenses on a royalty-free
basis from Atari." An Atari spokesman replied that "Nintendo is
full of it." Atari has a similar suit pending against Sega of
America Inc., a unit of Japan's Sega Enterprises Ltd.
Separately, Nintendo said it and Atari Games Corp. -
which is separate from Atari Corp. - settled all patent litigation
between them concerning alleged patent infringement and antitrust
violations, Nintendo didn't elaborate. Atari Games Corp. is 78%
owned by Time Warner, which is also a major investor in Atari Corp.
~
-------------------------8x CUT HERE 8x-----------------

Well, read then. QUED.

I do think, however, that ATARI could change their mind,
so It wouldn't really surprise me. Now, it *would surprise me*
if they decide to make further computer development while
the Jaguar- which will be the company's saviour- is still
fighting for market share and ATARI *is losing* money.

no, mail-order is available to everyone, and many places have dealers. Not
widely able to be seen beforehand, but for many people this is not a problem.
Okay, within the "new users who have not owned atari before" yes this is a
limitation.

>2. Lack of awareness: 'Whats a Falcon'

Not really a separate issue, this is a product of #1.

>3. Atari has publicly stated that they are a video game hardware company now.
> The Falcon is probably the last Atari computer.

No, there have been press released that have talked about "transition to a
video game company" This does not mean abandoming the computer line, but
the expansion to include a more active video game stance. THey can be
both a VGame company and a computer company. The computers were the focus
until now, but they are shifting to be primarily games. The computers are not
written off just yet, Pete.
>4. The Mac has enough inexpensive useful software and is heavely supported BY
> APPLE!

Ooh. supported by apple. FOr many this is a turn-off. and my Falcon has
"enough" inexpensive software, too.
>5. Mac and PC clones offer excellent price/performance over the Falcon.
not in terms of DSP or 16 bit D2D audio. Niche market, yes, for now. If
it had been marketed properly, the DSP and sound abilities of the Falcon could
have been seen as an amazing breakthrough and the next step in the multimedia
craze. As it is, we'll have to wait a bit longer (for someone probably not
Atari) to make DSP and 16 bit audio a must for all machines.

>6.Current 68XXX base Macs will be upgradeable to Power PC. No one will be left
>out.
no none? what about most mac users, who don't have PowerPC upgradeable
machines? or are you saying that the Mac pluss is PowerPC upgradeable? I know
you said "current" but not everyone has "current" macs.

>7. Lastly, Atari's warranty service is as bad as C='s.
Well, this might be true, but since in my 5 years of ST use, I've NEVER had anything break down (except my first ST had a bad sound chip when I bought it. the dealer fixed it) I would not know about the warranty service.

You are probably right there... but since this is affecting
pretty much everybody, not just Apple, did you read the
article I posted? ATARI is losing money...

It's sad though, as I want the Jaguar to succeed. No need
to remind me, I know C= is not healthly at all either...

> Mac advocates want to argue because they have full color glossy
> publications the sun revolves around them.

The Falcon is a nice machine but is overpriced. The argument is over
advocating the Falcon to new users who have not owned an Atari computer before.
There are barriers that makes it difficult to justify a Falcon to new users.
They are:

1. Not widely available in the USA.

2. Lack of awareness: 'Whats a Falcon'

3. Atari has publicly stated that they are a video game hardware company now.
The Falcon is probably the last Atari computer.

4. The Mac has enough inexpensive useful software and is heavely supported BY
APPLE!
5. Mac and PC clones offer excellent price/performance over the Falcon.

6.Current 68XXX base Macs will be upgradeable to Power PC. No one will be left
out.

7. Lastly, Atari's warranty service is as bad as C='s.

Christopher, when you make a transition, you go from one state to the
other. If you make a transition to a video game company it certainly
implies that either you abandon your computer line or at least put it
on a second priority queue.

Just in case, I know that looks like ATARI will eventually continue
laster on computer stuff.

Just another quick note Christopher:

The PowerPC instruction set provides for very easy emulation of DSP alike
functions. This was evidenced in a press release conference here
in Puerto Rico by Apple for the Latin American market, where they put
an 'AV AT&T DSP Mac' vs a "Power Mac" in DSP applications. The PoweMac
won. Considering the AT&T chip (DSP) is faster than the one in the
Falcon...

Actually, I think that the Jag chipset as soung & graphics processors should be a given. The debate as hinted at by Bob Brodie is whether to go PowerPC or Intel (pentium/hexium or whatever) Atari seems to be wisely waiting out a bit before deciding... Sometimes not having the money to do something can end up being beneficial. It means that they can pick who seems to be the winner of the next generation of chip wars... :)

I agree with "second priority queue" for the computers. Atari does not have (for now) the resources to really promote both, and with the Jag the more promising money maker, it makes sense for them to pursue that market.
I think we can agree that "for now" Atari will not be making any new machines. I don't consider that "dead" or "discontinued". Some people do.

> Just another quick note Christopher:

In what "application" though? Certainly for Word Processing or such I'd expect the PowerPC to win, but I'd _expect_ the DSP to win in things like fractals or JPEG decompression. Still, A PowerPC with a DSP would be even faster, no?

No Chris, it wasn't at a wordprocessing application but at several
DSP applications. Among those there were demos too. It was hard
to believe, but the PowerPC was winning... I wonder, there must be
some particular very specific case where the DSP should win at least! :-)

Yes, a PowerPC with a DSP would be even faster, but the point was
that the PowerPC Macs 'can get away' without having a DSP.

It would be foolish for Atari to use the Pentium. We all know that Intel has had a history of poorly designed processors, slower than their competition. We all also know that you can cook pizzas off a few pentiums. And finally, we know that the PowerPC is MUCH faster than Pentium. Intel has always been a moot point in my opinion, and even more so with the Pentium and the PPC outrunning it by leaps and bounds.

:#I've nver claimed that Atari rules in Sweden, learn how to read before posting,
:#I have however stated that it seems to sell alot better here than in USA.

Well considering that you can't find Atari dealers here in the 50th state
of the US of A. It isn't hard to conceive that Falcons sell better in
Europe. A single dealer over there will undoubtedly sell better than no
dealers here.

On the other hand, Jaguars are selling in the US, which makes it strange
that you can hardly find any Jaguars in Europe.

This is because up until now (possibly this is still true), they had a
lot more demand for the product than they had Jaguar's on hand - and
they decided for the moment to really focus on the US market first,
and not spread themselves too thinly across both markets.

There's no way the Intel can last any longer. It's too horribly designed, and people are finally starting to realize that. The PPC advocates who were once Intel advocates will be too proud to admit they were wrong, but they'll all go to PPC and be happy with it. The PPC is significantly faster than the Pentium, and as for backward compatibility, the 486 emulators for the the PPC will do very nicely for as long as we're forced to have them around before all the software is ported (which will take less time then you think). The PPC will take over, because it's MUCH faster than anything else and MOTOROLA CAN MARKET THE THING. It's an open-design architecture that allows designers to have some freedom, but is specific enough to make the machines compatible with each other, which are all very attractive features.

The PPC does have some things against it. First, it's designed after the RS6000, which, IMHO, is not a very good design. Motorola's had hell trying to both kiss up to IBM and make a good chip, and I think they've done a good job with both. They might have been better off if they'd started from scratch, but you'll notice that each successive model of the PPC is getting less and less like the RS6000. The 601 has registers in it that are for compliance with the design of the RS6000, but by the 603, some of them are gone, and by the 620, most of the design is different. Standard PPC compliant software does not use some of the registers in the PPC, because developers have been told that they would be replaced in future models. Another thing against the PPC is what I call the Microsoft Disorder. This is where compilers make executables 5 times the size they need to be because of laziness on the part of developers. This is where you are told that your hardware is outdated 2 months after you bought state of the art because someone's new word processor requires twice as much memory as you have and 40 megs on disk. This where programmer are so lazy that they code so badly that you need upgrade from the 603 to the 620 to get your process done in less than 10 hours. UNIX, Mac and Windows suffer massively from this. Recall the discussion about RAM Doubler on the Mac and how you can't do that on the Atari because Atari memory management isn't wasteful enough. Compile the same program on both a PC and on an Atari and see that the executable for the PC is several times larger, and this isn't just because of the processor's differing instruction set... this is because the compiler developers are idiots. All these problems will carry over to the PPC because Microsoft is going to cash in on this too and take over. Microsoft cares only about making money, doing whatever it takes, and their ploy to get everyone to believe that they always need MORE hardware, and NOT better software seems to have worked. Most people in the US don't know about the old days when 1k was hard to come by. They have been sucked in by the media hype and the pretty pictures they see on their boxes for Microsoft products that make their programs look nice. What they find out later is that they can't install the program because they don't have a large enough hard drive, and once they remedy that situation, they find out that

they don't have enough RAM, and when they buy more of that, they find that they have to scrap the whole system because their processor isn't fast enough. Once the get their new version of, say Microsoft Excel 5.0, they quickly discover that MSoft tried too hard to upgrade it this time, and now you can't use the program because all of the features have been moved and you don't have room on the screen to put all the toobars you need.

All this stuff will be carried to the PPC, so while the machine is technically wonderful, the industry is ***ked up and is going to make using a PPC as bad as using a Mac LCII or a 386 with Windoze. The PPC will indeed take over, but not without a whole lot of crap right along with it.

This is why I love my Atari. It may not be the fastest machine in the world, but it certainly MORE EFFICIENT I've ever encountered. The user interface is lighting fast, the text display just as fast. The software is power-packed, yet small and takes up very little memory. It's fast and clean. Selecting a block too big will cause WordPerfect for Windows to crash, but I have trouble TRYING to crash most Atari software. This is why I sincerely hope that Atari develops a PPC machine, because at least THEIR engineers will be able to make a nice machine, and the Atari developers will continue to write good software.

I have seen some of the Microsoft Disorder happen to Ataris to a limited extent. The machines finally started to improve in speed and capacity and as a result, some of the software has expanded to fit. Fortunately, this is not expanding at the rate that Microsoft causes the PC market to decay.

It's not possible to add a dsp to the LC475. But there is the dsp Quadra 660AV.
A dsp is not needed on the PowerMacs due to the high speed.

Chris, the PPC would not go away, BELIEVE ME! :-)

Intel is in *serious* trouble, unless they pull a fast/good one
with the Pentium or a new RISC that can emulate in hardware the
'486. The later, is what I think they might actually do.

|> goal, then the new Intel chips are pretty good, heat problems aside. With

They haven't eliminated backward compatabilities at all. In fact, they
want it, because is one of the strong reasons they use to defend the
Pentium.

|> the p6 already announced, who knows? I'm not saying that one is better than the

Hmm.. the P6 has not been announced, as in out. Intel just advanced
the schedule ahead 1 year, so in late 1995 we should see the 'P6'.

|> other, I don't know. All I am saying is that neither side is clearly a winner

Peter, please.

My original article was just repeating that was of interest to Atari users---
you know, politics, business plans and the like---it wasn't an invitiation
for you to go one about Macs and how wonderful they are. You didn't add a
damn thing worth reading if you an Atari user.

Now, I don't know if anyone else is going to add to this thread but if they
do I hope it is to add things.

You? Well, you I'm just gonna ignore from now on.

Xavier

: Nintendo and Sega will sell ten times that!

Doubtful. Nintendo and Sega probably have a few more years left in them, but
I doubt that they'll be major contendors within a year if they don't come out
with some new hardware. Nintendo plans on waiting around 1.5-2 years, and
Sega is rushing to try to get something new out by the end of this year.
Oh well, this is all silly anyways since the discussion was about the Falcon
or more to the point - Atari's computer line.

The price/performance is getting worse on the Falcon. This week Apple USA will reduce the price on Quadra 605 configurations. The 4/80 has been discontinued. The Q605 8/160 has been reduced to $1000. Apple will have a 4/160 bundled with ClarisWorks 2.1, Quicken 4.0, GoldDisks Astound and other titles for $1019. Who said software is out of reach? The Color Classic 4/80 with keyboard will be liquidated at $699. Source: MacWeek - April 25, 1994

I was unaware that Calamus was ported to the PC platform. Obviously it
hasn't done very well on that platform, though, or I would have heard
about it. (I've been involved in DTP for about eight years now and follow
it almost religiously.) :)

I understand and agree with your "best" position; my phrasing in my
message was probably a bit faulty. You're right; people don't *always*
buy what is best, but they often DO buy the most (overall) reasonable
product in a given field. PageMaker and XPress, for example, *far*
outweigh Calamus in professional application. Calamus, IMO, is comparable
to programs like Ready Set Go on the Mac: A competant program, but not
good enough for professional application.

Because Apple sometimes does things only halfway. :) For example, the
Mac has had the ability to read, write and format PC disks since about
1988 or so (starting with the IIx and SE/30, and soon thereafter on the
SE). To date, that ability *still* isn't built into the System software
(though it supposedly will be in the forthcoming System 7.5).

Lots of software supports stereo sound. Previously (read: before Sound
Manager 3.0 was released) only certain sound editing packages supported
it. (BTW, SoundEdit Pro *does* support 8-bit stereo; I use it on occasion
on my IIci.) Until that time, getting stereo sound to work *reliably*
was a rather difficult programming feat. Today, with SM3, it's cake. Many
games have been taking advantage of stereo Mac sound for years, and some
of 'em are even pretty decent. :)

Pete, I'm beginning to agree with Chris about you. What was the point of
posting this in an *Atari* newsgroup, other than to provoke and bash?
There *IS* no other reason, so just cut it out, okay? We're all, by now,
extremely aware that you worship the Mac as if it were some sort of deity
but that's NO reason to post stuff like this in hopes of provoking a
hostile response and/or to make people "feel bad" about the Atari.

I made a comment, awhile back, that the fanatical Atari loyalists with
the straight-line vision are an embarrasment. You're no better with your
Mac loyalism.

Really? Protext can save in a wide range of wordprocessor formats.

>>>And yes, a 33Mhz 030 *does* perform better than a Falcon. It's not simply
>>>the machine and the CPU, but also the software that runs on it. Show me,
>>>for example, a word processor on the ST that can contend with Microsoft
>>>Word. Or a desktop publishing program that can compare with QuarkXPress or
>>>PageMaker. Hell, even Atari *magazines* aren't produced on Ataris!
>>>MacWorld and MacUser, for example, are about 80% produced on Macs. How
>>>many full color, internationally distributed, 250+ page Atari magines are
>>>there at are produced on Ataris? There's a reason for that.

Not the one you're thinking of though. ST Review claimed that they originally
intended to produce their magazine using TTs with Calamus (the old 1.09N
version.) but that they had problems with the professional scanners only
producing pic formats more associated with Mac computers. (This point is
now a bit redundant though, since Calamus SL now supports these pic formats.)

As for "full color, internationally distributed, 250+ page magazines", I think
the reason might be more to do with the fact that there's hardly any 250+
Atari magazines- we like less crap in our magazines. :):):)

>Let me tell you something. I've used XPress and I've used Calamus. I've
>used them both in personal and professional capacities. I can honestly and
>without reservation tell you, from a professional standpoint, there is
>*ABSOLUTELY NO WAY WHATSOEVER* that Calamus can compete with XPress. None.
>Zero. Zip. Nada. Won't happen. Calamus on the ST is roughly equivalent to
^^^^^^^^^^^^^^^^^ (!!!!)
>Ready Set Go (earlier than version 6.0) on the Mac; it's a nice program, but
>it's sorely lacking in several features that are practically vital in a
>professional capacity. I've had fleeting contact with Pagestream, too, and
>I came away suitably unimpressed.

Well, I've tried Pagemaker on a Mac Plus, and it's really crap! :) Make a
slightly more valid comparision, will you? Have you tried Calamus SL on a
TT for example? Take a look at the review of "Alien vs Predator" in ST

Review this month (Fully produced in Calamus SL as a test.) and tell me that's *not* professional!

>>The reason Atari computers don't have 250+ page magazines in full
>>color is not that the Atari software lacks - it's that the user base
>>is not large enough to support such magazines.

>Now think about why the user base isn't that large. My guess? Because
>Atari US doesn't give a crap about its userbase.

Ahem. There are other countries than the US on the Internet.

>It's producing
>underpowered, overpriced computers. They can't get a single major business
>developer interested in supporting the ST (Microsoft? Borland? Lotus?
>Aldus? Adobe?),

Er, I haven't seen Photoshop for a Mac Plus! Again, pick a slightly more valid comaparision.

>and - like it or not - without the business software, the
>computer won't catch on in the home. History has proved this repeatedly.

This might be the case in the US, but not in the UK, where both Atari and Amigas have sold well, *without* help from any big business names.

>I haven't seen the speed difference first-hand, but I'll take your word on
>it. Now, where's that program that's "comparable" to Photoshop on the ST?

Well, Redactur already exists, and wait till Chroma 24 comes out- that really knocks spots off Photoshop.

Michael.

Yes, Pentium has heat problems. We haven't heard (yet) that PPC also
dissipates too much heat, but stay tuned. Did you notice that IBM
announced that the 100MHZ PPC is being touted for (among other things)
a reduction in heat dissipation from 8 watts to 4 watts? What is the
spec on the Pentium? The IBM announcement was 3/31/94, and the new chips
are not due out in volume until fourth quarter.

So for every dollar Apple make in sales, .8 of a cent is profit? That sounds
like a really well run company. The only reason Apple sell so much is because
they cut their prices to the point they can hardly make money. Sure, the HW is
cheap, but the software.....

Me. Do you know $$how much$$ desktop video programs cost on the Mac?
The 'Infini-D' costs about $800 and is by far very underpowered compared
to the average mature Amiga animation program.

I was checking out the PowerMacs until I checked out Mac animation
software... Tsk tsk... But then, I admit that for general purpose
uses, that Mac offer surely looks interesting (not for me though).

Actually, Infini-D costs $519 and includes a free PowerMac upgrade. It's
a competant program, but the Amiga (IMO) maintains a (narrowing) edge in
desktop video.

> I was checking out the PowerMacs until I checked out Mac animation
>software... Tsk tsk... But then, I admit that for general purpose

When I get a more potent Mac, I'll be doing DT video. A 25Mhz 68030 just
isn't good enough for that. :)
The Color Classic isn't, IMO, a practical computer. For about $200 more
you can get a MUCH better and much more expandable system.

>whiner like sinclap, MB, and that LORD guy!

To answer some of your speculations...

NO FLOPPY EJECT BUTTON: So the Mac can manipulate files across several floppies without having them all mounted, to keep track of multiple volumes with similar names, so that shared volumes (file sharing) aren't removed without notifying the network, and because it's cool. ;)
Besides, if you want an eject button, you can (a) unbend a paper clip and use the eject mechanism that's built into all Macs, or (b) purchase a third-party drive that has an electrical eject button.

10% MARKET SHARE: It's a bit higher than that, though I don't know offhand what the current share is. Besides, without trying to sound hostile, how can an Atari fanatic point the finger at Mac users for market share? What kind of market share does Atari have?

"NORMAL" PRINTER PORTS: Several reasons, actually. The printer port does many different jobs. It acts as an AppleTalk connection for the built-in networking capability. It can double as a second serial connector, if you like. And because it's smaller than a standard parallel connector, it can be installed in a multitude of items - such as the Newton. (Try and imagine a Newton with a huge Centronics connector for data transfer!)

RADIOACTIVE WASTE: Opinion, fostered by hostility. Not worth answering.

LARGE EGOS: Opinion, fostered by hostility. Not worth answering, aside from saying that this sort of sweeping generalization is laughable. I suppose you haven't met an egotistical PC, Amiga, Atari, or Sun user?

WHINING: Me? Whiner? *laugh* There have been two things that I've "whined" about in this newsgroup: Atari's blatant lack of support towards their users and their lack of any desire to expand their userbase, and some users' lack of facutal information to back up their accusations. If you think THAT'S whining, perhaps you should read your own posts...?

>* King of the Russians (in Civ) [a great game that isn't available on Mac]
Civilization isn't available on the Mac? Then perhaps I should return
thisbox with the big word "Civilization" on it that I have sitting right in
front of me?

>PS: If this looks like Mac bashing, that's because it is.
Duh.

>PPS: Is there anything to do in Iowa besides play with (and apparently
> worship) computers.
Dunno.

>PPPS: Who the hell is Raist?
Still drawing a blank.

>PPPPS: What the heck does that 2954 stand for anyway? The price of the
> cheapest halfway-decent Mac?
If it were the price of the cheapest halfway decent Mac, the number would
be somewhere around "895" for a 68040-based machine. Other than that, I
have no idea what 2954 stands for.

>PPPPPS: Mac Go Home!!
shrug Would you rather me blindly praise Atari, without thought, like
lemmings? Atari would LOVE that; it's just about the only way they're
selling computers these days.

>PPPPPPS: In 5 years, Apple will = Commodore.
Oh really? This is your own speculation, I assume? Wishful thinking? Any
solid factual information to back this up? And, praytell, where will
Atari be? I'm still waiting for an 040-based ST to come out of Atari's
factory. I mean, hey, the 040 has been out for how many years now?

>PPPPPPPS: *Except* it!!
I have *no* idea what this means.

>PPPPPPPPS: I wear flame-proof armor!
No flaming here, so this all might get through to you. Maybe.

All the above may be true, but not having a floppy disk eject
button is still damn inconvenient. Suppose you have to install
an application that comes on 16 disks, like MS Office. I would
hate to have to bring down a menu and click on Disk Eject 16 times!
>Besides, if you want an eject button, you can (a) unbend a paper clip and
>use the eject mechanism that's built into all Macs,
That's *REAL* elegant! Who the hell came up with that stupid design!
>or (b) purchase a
>third-party drive that has an electrical eject button.
I'd have to do that if I ever bought a Mac (which I won't).

>10% MARKET SHARE: It's a bit higher than that, though I don't know
>offhand what the current share is. Besides, without trying to sound
>hostile, how can an Atari fanatic point the finger at Mac users for
>market share? What kind of market share does Atari have?
Okay, about 15%. But that is still pretty small compared to
the IBM clone market. I'm not an "atari fanatic" by the way.
I had two Ataris (an 800 and a 130XE) when I was in grammar
school and still have some interest in what's going on in the
Atari world; that's why I occasionally read this newsgroup.
However, for the last six years I have been using IBM clones,
and the PC world is my primary interest now.

>"NORMAL" PRINTER PORTS: Several reasons, actually. The printer port does
>many different jobs. It acts as an AppleTalk connection for the built-in

>imagine a Newton with a huge Centronics connector for data transfer!)
I have a friend who had a Mac SE Freshman year. He tried to connect
a perfectly ordinary Epson dot-matrix printer to it and was forced
to buy an adaptor. However, even with the adaptor, the printer still
wouldn't work with his computer. (Incidently, he now owns an IBM
clone and has no intention of ever getting another Mac). The reason
for the non-standard printer port, like so many other Macintosh
"features", is to give Apple a captive market that allows them to
keep their prices artificially high.

>RADIOACTIVE WASTE: Opinion, fostered by hostility. Not worth answering.
>LARGE EGOS: Opinion, fostered by hostility. Not worth answering, aside
>from saying that this sort of sweeping generalization is laughable. I
>suppose you haven't met an egotistical PC, Amiga, Atari, or Sun user?
Take it easy, man! You take posts to seriously!

Yes, I have met egotistical PC, Amiga, etc., egotists. I have
also seen posts by such people in these newsgroups. However,
when it comes to putting down other kinds of computers in
newsgroups, the Mac egotists have no equal! The Atari and Amiga
advocacy groups have more posts by you, The Clap, and MB putting
down those computers than anything else. And incidently, why don't
you guys ever post anything in the MAC newsgroups? Is it simply
more fun criticizing other people's computers than discussing your
own with fellow Mac users?
>WHINING: Me? Whiner? *laugh* There have been two things that I've
>"whined" about in this newsgroup: Atari's blatant lack of support towards

>you think THAT'S whining, perhaps you should read your own posts...?
This comment was aimed at The Clap and MB, not you. Sorry
for the confusion. At least your posts are civil and sensible.
Their posts are rude and idiotic, especially Clap's.

>>* King of the Russians (in Civ) [a great game that isn't available on Mac]
>Civilization isn't available on the Mac? Then perhaps I should return
>thisbox with the big word "Civilization" on it that I have sitting right in

I reiterate, I AM NOT AN ATARI FANATIC!
I stand by may prediction. The Macs only strength is its ease of
use. Now that PC's are becoming easier to use (tho Windows has a
a long way to go) there is less and less reason to buy a Mac and
be subject to Apple's captive market.

The 100Mhz PowerPC is 4W, the 100Mhz P54C is between 4 and 6 with a
max of 11. This can happen if you do a lot of FPU etc, this turns on
other execution units.

In terms of speed/watt and speed/price the PowerPC is _much_
nicer than the Pentium family. About twice the speed for the
same dollar.

|>
|> When I get a more potent Mac, I'll be doing DT video. A 25Mhz 68030 just
|> isn't good enough for that. :)

I use a 68030 @ 50Mhz.

Now, here's what REALLY hilarious:

I did a small test case in Infini-D in the Quadra AV 880 (68040@40Mhz)
here in my college campus. My Real 3D V2.35 (the previous version)
came pretty close to Infini-D. My new version is about 35% faster
than before.

Of course, this were just specific cases, maybe with glass and other
complex reflections the gap will grow wider... or narrower :-)
The thing is: this was with my 'POOR' 68030@50Mhz with 50Mhz 68882 FPU!

I mean, the Quadra should have *CRUSHED* my machine performance wise,
and yet, my machine came out pretty close. The Power Mac Infini-D
is about 3-4 times faster (subjective, this one I couldn't time with
a watch) on the middle end PowerMac. If this holds, My Real 3D just
in a 68040@40Mhz should come close to the Power MAC!!!!!!!

Do you think I am impressed? :-)

|> The Color Classic isn't, IMO, a practical computer. For about $200 more

Actually, I believe intel will go soon (3-5 years) for the only purpose
they will have is keeping the then x86 clone companies alive.
The powerPC will become most popular... its being supported by IBM and APPLE
right now... and when PPC Compats come out... watch out. bye bye intel
That is of course if all the Commodore users stop buying that stupid
cd32?! of theirs that was just released here in the states.....then
Commodore will be the first to go.

Apple will move on with the PPC as will IBM. Atari, will, should?!?!,
start thinking about making a PPC system as well. If these 3 guys
can work together on a single platform... then maybe all our worries will
be over.

This is all because the Jaguar will be the next greates thing to sliced
bread. Nintendo will hang around for the kiddies and become the
now Atari2600 company concept. Sega? well...they can do more... maybe
the will build flight simulators for nasa...

>>The price/performance is getting worse on the Falcon. This week Apple
USA >>will>reduce the price on Quadra 605 configurations. The 4/80 has
been >>discontinued.

Having used a Mac Quadra650 extensively for the last month now, I
have to say that for a 33MHz 040 machine its very unimpressive. It is what
I would call `adequate` to use but doesnt deliver the blisteringly fast
speed I would expect an 040 to give. Using a 33Mhz 030 mac is obviously
even worse so the PowerPCs `40Mhz 030` emulation really isnt very useful
given that the Quadras are so much cheaper now. What _IS_ apple playing at
.. you`d think that they would be concentrating on making the PPCs more
affordable. Maybe since they have a captive market they think they can
rip-off their customers with the PPC...

Gavan.

Agreed. I never did like Intel's architecture. I just noticed IBM's
press release a few days ago and was surpriosed that the original PPC
dissipates 8 watts. It's very difficult to get rid of that much heat.

> an application that comes on 16 disks, like MS Office. I would
> hate to have to bring down a menu and click on Disk Eject 16 times!

You don't have to for several reasons. First, 99% of all Mac applications come with an Installer program. Insert the first disk in the set, launch the Installer program and, if applicable, select which options you want (there's also a default setting). The Installer will eject loaded disks and prompt you for other disks throughout the procedure. That's what "one-click installation" is all about. Furthermore, more and more programs (including Office, Illustrator, XPress, Photoshop and others) that normally take several floppies are now being released on CD-ROM. Insert the CD-ROM, launch the installer, select your preferences and relax. It's FAR more convenient than you may think; I thought the same thing when I bought my Mac, so I know where you're coming from. :)

> That's *REAL* elegant! Who the hell came up with that stupid design!

Like I said, it's much more convenient than you may imagine, and it's CERTAINLY more elegant than a side-loaded floppy (a la 1040ST).

> I'd have to do that if I ever bought a Mac (which I won't).

(that = buy an external floppy) I'd be willing to wager that you wouldn't. When I bought my Mac I thought I'd buy an external floppy. I didn't, and I still haven't, and I don't regret or miss it.

> Okay, about 15%. But that is still pretty small compared to

> and the PC world is my primary interest now.

My apologies, then. I was under the assumption that you were one of the many fanatics that are pointing fingers at me; I was, apprently, wrong. Sure, the PC has a huge market share. That still doesn't mean that I like 'em, though I'll probably be buying one (or an emulator) in the future. Why? Most of the best games are on the PC. :)

> keep their prices artificially high.

Apple *definately* doesn't have a captive market on printers! Hell, my own system has two non-Apple printers plugged into it! The reason why your friend needed an adapter is because the Mac needs to speak to the printer in QuickDraw, the Mac's native graphic language. There are scant few dot matrix printers available for the Mac. Why? Because higher resolution printers can be purchased cheaper. You can buy a 360dpi inkjet for $200; a 144dpi Citizen dot matrix printer is about $90 more. Your speculation on the "non-standard" printer port is therefore bogus.
(Speaking of nonstandard, let's talk about Atari's dedication to standardized ports, shall we? Try to connect a hard drive to my 1040ST. Try to connect ANYTHING "standard" to an Atari 8-bit. So far as I can tell, the only "standard" contribution Atari has made is joystick ports. How about networking? AppleTalk *is* the standard low-level networking protocol!)

> Yes, I have met egotistical PC, Amiga, etc., egotists. I have

> you guys ever post anything in the MAC newsgroups? Is it simply
> more fun criticizing other people's computers than discussing your
> own with fellow Mac users?

(Who is "The Clap" and "MB"?)
I *have never* put down the Atari computer. Sure, I've pointed out things that are wrong with it and with the company behind it, but so what? I've done the same thing with the Mac. Is it so wrong to actually *think* about a computer and point out things that could be better? The vast majority of my posts here deal with correcting the unfounded and/or false and/or unsubstantiated claims that are made against the Mac. I don't care if anyone here doesn't like the Mac. I don't care if it's bashed; frankly, I've come to expect that from Atari (and other) newsgroups. What bothers me is when people make silly attempts to platform bash by making false accusations (i.e., no stereo sound). Opinionation is fine. Claiming false information as factual is not.
Oh yes...I *do* post in the Mac newsgroups. Most of my posts there, however, are email responses to people who have questions. I'd say, on average, I reply to about two dozen messages in the Mac newsgroups every day and most of them are left in mail, so they're not public. People who ask questions that have an answer that could benefit many, however, I usually reply publicly.

> This comment was aimed at The Clap and MB, not you. Sorry
> for the confusion. At least your posts are civil and sensible.

> Their posts are rude and idiotic, especially Clap's.

Exception noted. Thank you.

> Really? When did Civ for the Mac come out?
> I guess I was wrong on this one...

Several months ago, I think. I picked it up at CompUSA.

> I'm man enough to admit I made a mistake.

As am I.

> I would rather you praise your Mac in private and leave everyone
> else alone!

I pick on NOBODY. I attack NOBODY who doesn't attack me first. I *DO NOT* enter messages which say, in essence, "trash your shitty Ataris, buy Macs instead." *EVERY* statement I had made was either an answer to Mac-related question, or a correction to a false statement made regarding Macs. If you view those messages as praise, then perhaps that's telling you something.

> I reiterate, I AM NOT AN ATARI FANATIC!

And *I* reiterate: At the time of your post, I was unaware of this. Calm down.

> I stand by may prediction. The Macs only strength is its ease of
> use. Now that PC's are becoming easier to use (tho Windows has a
> a long way to go) there is less and less reason to buy a Mac and
> be subject to Apple's captive market.

PC's still have a LONG way to go to match the Mac's ease of use. Almost every program, every hardware upgrade, every modification requires extensive knowledge of DOS (or whatever OS you use), modification of batch and configuration files, etc. Install a hard drive in a PC, and install one in a Mac. *HUGE* difference, and do you know what? People *want* computers that are easier to use. If they didn't, the Mac would have failed LONG ago, Windows and OS/2 wouldn't exist (nor would any other GUI), and we'd all be typing on heavily hacked Atari 2600's. Apple's "captive market" is nothing of the sort. Just because they own the OS and want to control where it goes makes them evil? There's a very good reason for that, and it's precisely the reason why the Mac's "friendliness" is *demonstratably* superior to any other platform's. A standardized interface, a simplified way of doing things...These are things that became popularized on the Mac and "copied" elsewhere. (And yes, I know about Xerox.)

Yes, narrowing. If for no other reason, than because Commodore has, by their own admission, all but abandoned the US marketplace. How far is video production - or ANY application - going to go on a machine whose company has all but given up on it?

> I did a small test case in Infini-D in the Quadra AV 880 (68040@40Mhz)

Probably not, but I'm going to recheck your figures as I have access to nearly identical equipment. I'll let you know in a few days what happens. I find it *terribly* difficult to believe than a 40Mhz 68040 with a DSP chip can't render faster than 50Mhz 68030 w/FPU (the '040 has an FPU also, btw). I can, if you like, upload the test image, though it'll probably be huge...

Well, have you used Real 3D on the Amiga or LightWave? You'll
understand. It's like on the PC: if you only have used Windows,
of course Windows is nice- there's nothing else! :-)

|> > Narrowing... I don't know about that. You should check out the

Explain then why Babylon 5 and Seaquest are produced using Amiga
equipment. Also explain the increase in Amiga interest in TV production
and in Hollywood. You should even check out the new Toaster Flyer.

It will be narrowing because of the software. Even if C= goes
Chapter 11 finally, and I switch to a Mac, I still face the same
problems animation wise (software).

|> Q-880? Try 840AV, likely, based on your speed rating.

Sorry. I mean the high-end AV Quadra. Yes, the one with that
68040 @ 40Mhz. Believe me, I tried.

Do you have Amiga's near?

|> I find it *terribly* difficult to believe than a 40Mhz 68040 with a DSP
|> chip can't render faster than 50Mhz 68030 w/FPU (the '040 has an FPU

The DSP is not used on that Mac AV for rendering. It's used for
speech recognition, modem emulation and other things....

|> also, btw). I can, if you like, upload the test image, though it'll
|> probably be huge...

I found it very hard to believe too. But let me tell you that LightWave
was at least 3 times faster than Real 3D... but then I admit, it was a
specific test case.

This may be true today, but it wasn't back then. My friend (the one with
the printer problem) told me that the only printers that worked with the Mac
without a hitch were, surprise! surprise!, APPLE PRINTERS. If that isn't a
captive market, then I don't know what is. Of course, my firend could have
been wrong, but I don't think was: he knew people who were very knowlegeable
about Macs. And by the way, I don't give a damn about Atari ports. As I
said, I haven't used an Atari for 6 years and don't care what can or cannot
be connected to it.

>(And yes, I know about Xerox.)

I have to agree with you on hard disks. I installed a new hard disk on
my computer 2 years ago, and it was a mess of dip switches, inadequate
documentation, low-level formatting, system configurations modifications,
and calls to Western Digital! This process took me a whole damn month!
However, if Plug-n-Play (I hate that term by the way; it sounds like the
name of a toy for toddlers or something) lives up to its promise (tho I'm
skeptical because I don't rust MS as far as I can throw it, which isn't

very far), this problem will be solved for PCs. IBM's spec for PPC clones, PReP, also promises to solve this problem. However, all the above is still mostly vaporware at the moment. Maybe next year....

No don't think Apple is evil. Heck, I don't even think Microsoft is evil! However, you still can't deny that the Mac is a closed architecture and that that makes Mac peripherals more expensive.

Yes, Windows (which I think we both agree has a LOOOONG way to go) is a copy of the Mac interface, tho a flawed one. However, for novice users, it is still a lot easier than DOS (or at least it is so long as they don't have to touch that abominable win.ini file) and in many cases is good enough. I mean, why is that all of a sudden Apple slashed their prices when Win 3.0 came out? Because it greatly lessened Apple's ease of use advantage.

The installers that commercial applications use to install themselves eject
the disk automatically. If you don't like using the menu, you can eject it
using the keyboard or by removing the icon from the desktop.

>>Besides, if you want an eject button, you can (a) unbend a paper clip and

Lots of companies make printers that work on the Mac. There is no captive
market for Apple. As for your friend, it probably didn't work because he
didn't have a printer driver for it.

lordthan@news.delphi.com (LORDTHANATOS@DELPHI.COM) writes:

[deletia about mac floppy drives]
Yes, the original poster apparentkly had never really used a mac, and did not know about the system ejecting of floppies...
Still the Apple way of handling disks is just another point in the main reason why people call macs "computers for stupid people" which is that the system tries to think for the user, instead of allowing the user to tell the computer what to do. i.e. "I (the computer) know when floppis should be ejected or not." and "I know whether they mean to move or copy a file when it is dragged on the desktop" Personally, I find those sort of "features" very condescending and want to take a bat to the machine when it does something wrong because the way to tell the computer to do something other than the default interprwetation of my actions is usually bured and inaccessable somewhere.

>My apologies, then. I was under the assumption that you were one of the

>Why? Most of the best games are on the PC. :)

The ting is, for every "apple sells more than Atari" post, there is the simple fact that Clones outsell everything. For every "but the Mac is easier than the PC to use" There is the widely held opnion among Atari owners that GEM is much more straightforward than Mac Finder. It really is tough to advocate a Mac, since for every reason, there seems to be someone doing it better... ;)

No, but you almost always have to buy an "Apple" compatable printer...
Just look at the DeskJet vs Deskwriter. WIth my Atari machines, I can pick up just about any PC compatable printer (of which there is a larger variety than mac-compatable printers) and plug-n-play.

The "unusual" HD port on the ST was because of the use of DMA technology, for which there WAS no standard (hey, in 1985 what WAS standard?) but since then the TT has had a standard SCSI port, and the Falcon has a SCSI-II port. The mac has non-standard serial & parallel ports, monitor ports (15 pins so you can plug in a VGA to some, but why did they have to do the 2 row instead of the standard 3 row config???)

I can buy any printer, any modem and any VGA type monitor for my Falcon (since you need the $10 plug for ANY video connection on the falcon, I'm not counting it as extra) and run with it...

>usually reply publicly.

My final word on stereo: I'll assume you are not lying or mistaken, and accept your last post as truth about the ability to do stereo. Since then stereo was a "hack" to do (i.e. the OS did not support it) and since very few programs did ((I've known over 30 mac programmers, all of them very good at hacking, and not one of them ever mentioned it. I've also played many games and done much sampling though an LCII and NEVER was avle to get SOundEdit pro to record stereo from a CD) I then consider it "capable" of doing stereo, but it did not "support" stereo, which the ST has since the STE. (just look at the sound CPX which lets you set the stereo capabilities or any MOD player since the STe which has supported stereo)
Along those lines, I do not count Overscan or graphics card additions as indicators of what the ST line supports. Sure, you can get a NOVA card for an ST and get 24 bit color, but does that mean that the ST has 24 bit color? If the ability to do stereo was widespread among Mac owners, that too might indicate that it was a standard addition, but you are the only mac person I have ever heard of, despite the hundreds I have known, who has ever mentioned this ability. Therefre, since less than 1% of mac owners "do" stereo on older MacII computers, it is not supported. Hence I can say that the Falcon is not limited by 640 x 480 since it is considered a standard addition to buy a screenblaster or BlowUP or some other product to expand the screen. (the difference is it is supported, but not out of the box)
So, my current phrase is "I have heard that the MacII can do stereo, but it was never really supported until the AV and Centris machines."

Hence, the ST had OS Supported Stereo sound before the Macs did. Now, can we drop this because it is really a trivial point... I could care less who had what first... :)

Yeah. All that sitting behind a desk, staring into a monitor all day... ;)
I felt *exactly* the same way you do about the Mac's floppy drive. I even
used to bad-mouth and mock it - until I started using it. When having a
hard drive on a Mac was a really big deal, having no eject button was a
pain since it's faster to manually eject a disk than it is to have the
Mac eject it. But once hard drives became standardized, the floppy drive
faded into oblivion. My own drive is used pretty much on rare occasions;
giving software to my girlfriend, collecting "extras" for programs I have
(i.e., Photoshop filters, Quark XTensions, etc), and loading new software
that isn't on CD-ROM. 99% of the "temporary" access files I have are on
SyQuest cartridges.

When the Mac first came out, you're right, things were quite different.
However, I was under the impression that we were referring to 1994, not
1984. Today, there's a variety of manufacturers making printers of all
types, from $200 inkjets and $150 label printers to $35,000+ high
resolution imagesetters to $10,000+ dye sublimation color printers.

>The Clap = sinclap2954 = Peter Sinclair-Day = biggest loudmouth on the net

(That was "Chris.") Like I said, I attack nobody who doesn't attack me first. Chris has (Had? He hasn't posted in awhile.) a problem with distinguishing answers and civil conversation with bashing and bad-mouthing, so I asked him to stay off this thread until he learned the difference. This was, above all, to keep the heavily biased fanatacism out of the way of objective conversation - and it's the reason why I started THIS thread rather than staying involved in the existing ones, which Chris (and others) had turned into mudslinging contests. I didn't want the same thing to happen here.

>I'm always calm here. Do you really think that anything that is said on this

IT'S NOT?!? ;)

> The 2600 was a game machine, not a personal computer!
> Maybe you meant the 400 or the 800.

What's wrong with the 400? I have one of those... :)
No, I meant the 2600. I guess you don't remember the good ol' Atari 2600 BASIC cartridge and "keypad" system? Gave you all of about 1.5K to program in and, I think, all of ten BASIC commands (if memory serves, REM, GOTO, END, LET, PRINT, COLOR, SOUND, IF, and THEN) and five variables of no more than 10 bytes each. Yes, it was real. No kidding. :) You can sometimes find the cartidge at Kay-Bee toy stores.

>I have to agree with you on hard disks. I installed a new hard disk on
>my computer 2 years ago, and it was a mess of dip switches, inadequate
>documentation, low-level formatting, system configurations modifications,
>and calls to Western Digital! This process took me a whole damn month!
>However, if Plug-n-Play (I hate that term by the way; it sounds like the
>name of a toy for toddlers or something) lives up to its promise (tho I'm
>skeptical because I don't rust MS as far as I can throw it, which isn't
>very far), this problem will be solved for PCs. IBM's spec for PPC clones,
>PReP, also promises to solve this problem. However, all the above is still
>mostly vaporware at the moment. Maybe next year....

"Plug & Play" (I agree w/you on that term, btw) on the PC reminds me of the infamous Atari chant: "Atari will be back and they'll be better than ever!" I've been waiting almost ten years for Atari's comeback, and I know people who have been waiting almost as long for P&P on the PC. The Mac has, and always has had, a simplistic expansion philosophy. The PC has never and really still doesn't have it, and it's been out longer than the Mac.

>No don't think Apple is evil. Heck, I don't even think Microsoft is evil!

Maybe you should think about that Microsoft thing... ;)

>However, you still can't deny that the Mac is a closed architecture and that
>that makes Mac peripherals more expensive.

Well, yes and no. I feel Apple should have licensed the Mac OS a long time ago, yes, and they're doing it now. You can run the Mac OS on Sun

and other workstations now, and pieces of the OS are being licensed to vendors such as Daystar (for Mac->PowerMac upgrade cards) and Insignia (for Mac OS on - gasp - Intel machines, which is still in alpha testing, I believe). It is MY opinion, however, that the SLIGHT added cost for a Mac peripheral is more than made up for in the ease of use department. There is, perhaps, a 5-10% difference between comparable Mac and PC peripherals, which could equate to between $5 and $100 for $100-$1000 peripherals. To me, spending $250 on a hard drive that I can have up and running in a few seconds is worth the difference over a $235 hard drive for a PC that I have to fiddle with jumpers, DIP switches, CONFIG files, etc for hours (or more).

>Yes, Windows (which I think we both agree has a LOOOONG way to go) is a copy
>of the Mac interface, tho a flawed one. However, for novice users, it is
>still a lot easier than DOS (or at least it is so long as they don't have to
>touch that abominable win.ini file) and in many cases is good enough. I mean,
>why is that all of a sudden Apple slashed their prices when Win 3.0 came out?
>Because it greatly lessened Apple's ease of use advantage.

Agreed there. Apple simply needed market share; no crime in that. Personally, I rather like the notion of being able to buy a comparable Mac for less than the cost of a PC clone. :)

>* King of the Russians (in Civ) [First available on the PC]

Pthththbt. ;)

>* I still think real computers have disk eject buttons :-)

Real computers use 8" drives. :)

2040. Re: Apple USA reduces Quadra 605 price!

Oh, Guys, could you PLEASE stop this mindless bickering? I could care less what someone else things about my Atari, because I like it. I have enough self-confidence that I don't have to defend my computer's capabilities every time some one wants to say something about it. I know what my Atari can do and I know what the other machines do, so I don't need to have this crap coming into the newsgroup every day reminding me of things I already know, showing me how little people know about someone else's computer, and irritating the fire of me be because I want to talk about something important. This discussion will NEVER get anywhere, and it's totally pointless. GIVE IT A REST!!! Let's talk about Atari's here, not how horrible or wonderful one computer is compared to another. I've done it all before. I've seen all the arguements. I know what the machines can do, and arguing about it is the most moronic thing you can do.

Let's talk about Atari here! How about we discuss Issues #1 and #2 of Processor Direct magazine? What did you think of issue #1? I thought it looked pretty slick. What are your feelings about what you think Issue #2 will be like?

2041. Re: Apple USA reduces Quadra 605 price!

I for the Atari users to continue the discussion just feeds it and makes it worse. I know it's hard, but all of the Atari users here should just let the Mac guy(s) and PC guy(s) flap their mouths (tap their keys?) all they want. We don't really care what they think. We're happy, and we're going to talk about Atari stuff now, no matter HOW hard they try to distract us. We're smarter than that.

>and want to take a bat to the machine when it does something wrong because
>the way to tell the computer to do something other than the default
>interprwetation of my actions is usually bured and inaccessable somewhere.

I feel differently. Who else, aside from the computer, knows when a
floppy is needed and when it isn't? Any user could think, "well, I'm the
user, and I'm deciding that the computer doesn't need this disk any more
even though it's in the middle of a write sequence." This type of
behavior simply can't happen on a Mac. Neophytes are spared the potential
to damage their data/systems, while more experienced users get their
computers to "help" them with the tasks at hand. Personally, I rather
like the fact that my Mac "hands me" floppies, CD-ROMs, etc when it's
done with them. :)

>The ting is, for every "apple sells more than Atari" post, there is the simple
>fact that Clones outsell everything. For every "but the Mac is easier than the
>PC to use" There is the widely held opnion among Atari owners that GEM is
>much more straightforward than Mac Finder. It really is tough to advocate a

nods :) I wouldn't necessarily say _better_, but someone is always
offering an alternative. Patter of opinion.

>Just look at the DeskJet vs Deskwriter. WIth my Atari machines, I can pick
>up just about any PC compatable printer (of which there is a larger variety than
>mac-compatable printers) and plug-n-play.

Point being...? With the exception of dot matrix printers, for which
there is a pathetically scant calling for, there is no shortage of Apple
printers. In fact, I'd be willing to bet that there are more high
resolution printers (i.e., laser, inkjet, dye sublimation) designed for
the Mac and then "adapted" to the PC than the other way around. So what
if the DeskJet came first? The DeskWriter is just as good, doesn't cost
any more, and is equally as available. Like it or not, the Mac brought
laser printing to the home user; all related printing stems from that.

>The "unusual" HD port on the ST was because of the use of DMA technology, for
>which there WAS no standard (hey, in 1985 what WAS standard?) but since then
>the TT has had a standard SCSI port, and the Falcon has a SCSI-II port.

>The mac has non-standard serial & parallel ports, monitor ports (15 pins so
>you can plug in a VGA to some, but why did they have to do the 2 row instead
>of the standard 3 row config???)

In '85, SCSI was just getting its foothold as a standard high-speed
interface. It was definately available as an alternative to the kludgey
DMA port, but Atari looked the other way. They fixed things eventually,
sure, but they could have gotten it right the first time.
Parallel and serial ports I had already explained; I'm not going to
explain it again.
The monitor port is a little tricky to explain. Many current Macs can use
VGA/SVGA monitors as an alternative to "Apple-type" monitors. However,
there are often differences. An average SVGA monitor, in my experience,
doesn't have the same sort of quality that an average "Apple-type"
monitor has. The initial reason why Apple chose to have their own monitor
port was because, back then, a high resolution SVGA monitor simply wasn't
good enough for the type of work Apple wanted the Mac to be in: Desktop
publishing, where individual pixel work is often important. Today, SVGA
monitors are better - and Apple's computers will work with them.

>I can buy any printer, any modem and any VGA type monitor for my Falcon
>(since you need the $10 plug for ANY video connection on the falcon, I'm not
>counting it as extra) and run with it...

I can buy any comparable printer (i.e., DeskWriter vs DeskJet), any
modem, and any VGA-type monitor for any current Mac (without a $10 plug)
and run with it, too. Point?

>My final word on stereo: I'll assume you are not lying or mistaken, and accept
>your last post as truth about the ability to do stereo. Since then stereo was
>a "hack" to do (i.e. the OS did not support it) and since very few programs

>it did not "support" stereo, which the ST has since the STE. (just look at the
>sound CPX which lets you set the stereo capabilities or any MOD player since
>the STe which has supported stereo)

Here's the deal (again) on Mac stereo.
The Mac has had stereo sound output since the Mac II and SE/30; the
owners manuals will confirm this, if you care to check. It is, of course,
far more space-effective and easier to implement mono sounds than it is
(was) to implement stereo sounds, so many games worked in mono only. The
hardware and the System software were both capable of generating and
supporting stereo sound; if you care to visit my house, I'll demonstrate
SoundEdit Pro on my IIci, if you like. However, up until Apple released
Sound Manager 3.0, getting stereo sound to work in perfect harmony
(pardon the pun) with the rest of the system was a rather major
programming task. Today, with SM3, it's very easy - and lots of
sound-related and entertainment software is taking advantage of that.
Stereo sound was not a "hack," nor was it wholly neglected by the OS. It

was merely a difficult procedure, akin to getting 512 colors on a
520/1040ST's screen at once. Atari acknowledged it could be done (heck,
you could even get 256 colors on an 8-bit) and it was lightly supported
by the OS (remember the rainbow color cycling effect?) but it wasn't a
"hack."

>Along those lines, I do not count Overscan or graphics card additions as
>indicators of what the ST line supports. Sure, you can get a NOVA card for
>an ST and get 24 bit color, but does that mean that the ST has 24 bit color?

If I follow you correctly, you're saying that even though you can add
functions with third-party hardware, that doesn't mean that the host
system has that function built-in. In which case, I agree. Adding a
16-bit sound card to a computer that otherwise chirps and whistles
through a mono speaker does not bestow 16-bit sound power to the computer
itself. It's merely an upgrade.

>If the ability to do stereo was widespread among Mac owners, that too might
>indicate that it was a standard addition, but you are the only mac person
>I have ever heard of, despite the hundreds I have known, who has ever mentioned
>this ability. Therefre, since less than 1% of mac owners "do" stereo on
>older MacII computers, it is not supported. Hence I can say that the Falcon
>is not limited by 640 x 480 since it is considered a standard addition to
>buy a screenblaster or BlowUP or some other product to expand the screen.
>(the difference is it is supported, but not out of the box)

I'd be willing to bet that your car can go faster than 100mph. I'd also
be willing to bet that you probably haven't taken it up to that speed
very often, if at all. Furthermore, chances are that the vast majority of
people who own cars similar to yours aren't going to take their cars to
that speed either. So, since a tiny percentage of the owners of your type
of car don't hit 100mph, then, by your logic, we can safely say that your
car is incapable of that speed? I think not.

>So, my current phrase is "I have heard that the MacII can do stereo, but it was
>never really supported until the AV and Centris machines."

A better phrase for you to work with would be, "The Mac II and forward
can do stereo sound, but it was never fully exploited until Sound Manager
3.0 came out last year."

>Hence, the ST had OS Supported Stereo sound before the Macs did. Now, can we
>drop this because it is really a trivial point... I could care less who had
>what first... :)

Hence, the ST had more programs to exploit stereo sound before the Macs
did. That'll work.

>THough you do have to watch yourself. I still remember your letter in which
>you said "this is not a flame" after you tried to flame me 4 times in the
>same letter...

The one where you deftly avoided all of my questions, and ignored 95% of my answers?

>And everything on a Mac is easier to do on an Atari... IMO of course.

So long as you understand that it's your opinion, fine. On my own experience, I feel otherwise.

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
You hit it on the nail right here! The disk eject button is
definitely faster than the Mac's software disk ejection. For
this reason alone, if for no other, the lack of disk eject button
will remain my #1 Mac pet peeve. However, you are also right
that floppy disks are quickly fading into oblivion, especially
with the advent of CD-ROMs. And who knows...maybe with the Power
Mac's new speech recognition technology you can simply verbally
order the computer to eject a disk; that would be neat.

>When the Mac first came out, you're right, things were quite different.

I certainly remember the good ol' 2600 (a.k.a VCS). There is a
circa 1980 Atari 2600 rotting in the basement as we speak. I had
forgotten about their BASIC cartridge, with its funny controller
and everything. It mustn't have been much of a personal computer,
but it couldn't have been worse than the Coleco Adam (or that
effront to humanity, the TRS-80!).

>Well, yes and no. I feel Apple should have licensed the Mac OS a long
>time ago, yes, and they're doing it now. You can run the Mac OS on Sun
You're right that the Macs have made a lot of progress in recent
years in the openness department. However, they still have a
long way to go in the openness department, just as the PC clones
have a long way to go in ease of use. I read in the April issue
of Byte that altho Apple is now licensing the Mac OS to other
vendors, they to license it to vendors who would "compete head-
to-head against genuine Macs." In other words, no significant
Mac clone market. I don't think that they will ever endorse
PReP (assuming that that becomes a standard) either.

Actually my number one complaint about the Mac is that the OS doesn't support dynamic memory allocation. This is why apps have to allocate so much memory when they load and don't use much of it. That's because an app can't increase or decrease the memory it's using while it's running. Since they often use standard methods of managing their own memory, ram doubler is able to get around some of these problems, but as soon as I found out that the Mac OS does not support dynamic memory allocation, I decided that I would NEVER buy a Mac. Period. End or story. End of discussion.

(In regards to Steve's comment about non-standard ports on the Atari)
It isn't really fair to make this comment based on the 1040 ST.
At the time Atari tried to go its own way with the DMA port. And,
from what I've heard, it is very nice to use with an Atari-specific
hard drive. However, the difference between Apple and Atari is the
printer port and modem port. These ports have always been standard
on the ST (the IBM standard). Also, Atari has shifted to SCSI-II
for their Falcon. Heck, Atari Falcons even have Localtalk :-)
(not that they're much use) :-(. It is much easier to buy peripherals
for the Falcon considering I only have to go to a local IBM store
(I have no local Mac stores).

Oh, jeez... I can see why you Atari users keep coming back to argue with the Mac users. They make errors.

At least Atari HAS DMA! Until recently the Macs didn't have DMA SCSI... it was entirely interrupt driven, along with everything else that the Mac did. This is why it was so damn slow... you had to format even your slow hard disks with a 2:1 interleave because the Mac couldn't handle the data rate. Now, there are finally coprocessors and DMA in the Macs, but they still suffer from various brain-farts of the designers. Atari, on the other hand, had DMA from the beginning, which is why they were so much faster with hard drives.

Source record: 17343

Tim,
Did you really like Processor Direct? How does it compare to
Current Notes? For me, right now, I much prefer Current
Notes to ST Informer because the quality of writing in CN is
so much better. I try not to let the typos get in the way of
the info in ST Informer (and there is good info) but it is tough
to overlook some of the mistakes. For example, in the review
of Walz ST Informer kept printing "Waltz." I mean, they should
at least try to get product names right. In CN nothing can beat
Dave Small and David Troy. Both of their columns are always great
reading. Not too often do I laugh out loud reading a computer mag!
Anyway, I'm babbling so I'll sum this up.... should I get a copy
of PD?

>HAPPENED to reply with "I just picked up a PC mag which contained an ad froum
>an Atari dealer about the Falcon" ... Stefan didn't reply.

Uhm.. Someone, somewhere, has a fuzzy memory. I said that while browsing
through a couple of generic swedish computer mags, I only found one ad, which
didn't list any titles, but had a small box in the lower right corner of the
ad saying that they had Atari software. I didn't claim there were no ads
anywhere, just that the mags I happened to have about didn't have any.

I have the article in question on file if you can't recall it.

>You've claimed I'm such an Atari fanatic, please explain why I sold my Falcon
>yesterday and am planning to buy a 486dx/40 tomorrow.

1: Well... Uhhh... huh. huhuh. uhhhh... Because you can play DOOM on it?

2: Uhh.. huh. huhuh. Yeah. DOOM is cool.

>(And no, it's not because the Falcon sux, because it doesn't)

Uhh... huh huhuh huhuh. I hate stuff that sucks. Huh. Huhuh. Huhuh.

Yeah. Me too. huh. huhuh. huhuhuh.

Uhhh.. <slap> Maybe I shouldn't watch eMpTy-Vee so late at nights.

Well, anyway, have fun with your PC.

>like the fact that my Mac "hands me" floppies, CD-ROMs, etc when it's
>done with them. :)

Actually, I know better than the Mac 95% of the time. I'm about to save
to a floppy, and I want to check if it's write-protected. I cannot simply
pop out the disk and check, I have to go to some point in the program where an
eject buttion is avail (or switch back to the finder) wait as system 7 grinds
for 10 seconds or so then ejects the disk (and immediately puts up a dialog
asking for the disk back) check the disk and reinsert it. Or, I have to
search around for a paperclip and unbend it. I'd rather just pop it out look,
and pop it back in. THis is onw example, I can give you others.

>Point being...? With the exception of dot matrix printers, for which
>there is a pathetically scant calling for, there is no shortage of Apple
>printers. In fact, I'd be willing to bet that there are more high

>if the DeskJet came first? The DeskWriter is just as good, doesn't cost
>any more, and is equally as available. Like it or not, the Mac brought
>laser printing to the home user; all related printing stems from that.

The point is that you still have to make sure that they are "mac-compatable"
printers. I can get just about any printer and it'll work. At worst for the
Atari side, it is just as easy to find a printer for the Atari than for a Mac.

>In '85, SCSI was just getting its foothold as a standard high-speed
>interface. It was definately available as an alternative to the kludgey
>DMA port, but Atari looked the other way. They fixed things eventually,
>sure, but they could have gotten it right the first time.

but DMA was faster than SCSI. That was the point of going with it.

>Parallel and serial ports I had already explained; I'm not going to
>explain it again.

I guess I missed it, but don't worry about explaining it. Apple has always
gone with different ports just for the sake of being different. How else
can you explain option and command as opposed to control and alternate on the

keyboards? They just wanted to be different.

>I can buy any comparable printer (i.e., DeskWriter vs DeskJet), any
>modem, and any VGA-type monitor for any current Mac (without a $10 plug)
>and run with it, too. Point?

Right. you need a plug that costs more than $10 to convert the 15 pin in 3
to the 15 pin in 2 rows for it to work on a mac. Again, at worst the Mac is
no more convenient than an Atari.

>Here's the deal (again) on Mac stereo.
>The Mac has had stereo sound output since the Mac II and SE/30; the

>you could even get 256 colors on an 8-bit) and it was lightly supported
>by the OS (remember the rainbow color cycling effect?) but it wasn't a
>"hack."

"Rather major programming task" = hack. Spectrum 512 is a hack. Video
interrupts on the 8 bit was a hack. Today, it appears with SM3 to not be
a hack.

>If I follow you correctly, you're saying that even though you can add

>that speed either. So, since a tiny percentage of the owners of your type
>of car don't hit 100mph, then, by your logic, we can safely say that your
>car is incapable of that speed? I think not.

No, I'm not saying "incapable" but I do say that my 4Runner is not a car
that is made for going over 100 mph. A Ferrari, OTOH, is. Your Mac is
not incapable of doing stereo before SM3, it was not intended for stereo,

though. (please do not equate that I am saying my falcon is a ferrari and you
mac is a 4runner... I haye computer/car metaphors)

>>So, my current phrase is "I have heard that the MacII can do stereo, but it was
>>never really supported until the AV and Centris machines."

>A better phrase for you to work with would be, "The Mac II and forward

No, the point is not to find out which CPU is faster, but to compare the
end result of our favorite rendering software, which is much more indicative
of user-apparent speediness than math benchmarks.

>of course Windows is nice- there's nothing else! :-)

Yes, I've used LightWave and seen Real 3D. Very impressive. You seem to be attempting to get me to admit that the Amiga is better than the Mac in video production. Is this what you're looking for? If so, pay better attention; I said that a long time ago.

> Explain then why Babylon 5 and Seaquest are produced using Amiga
>equipment. Also explain the increase in Amiga interest in TV production
>and in Hollywood. You should even check out the new Toaster Flyer.

Because they're the cheapest way to get decent broadcast quality video. Whether or not there's interest in the Amiga is moot at this point; Commodore has flatly stated that they're going to phase out Amiga support in the US. They're going to cease shipments of the A4000, for example, to the US; the only way you'll be able to get them is to buy them from Europe, or to buy them from someone who has imported them from England.

> It will be narrowing because of the software. Even if C= goes
>Chapter 11 finally, and I switch to a Mac, I still face the same
>problems animation wise (software).

I dunno of they'll go Chapter 11, but I *do* think they'll be spending 99.5% of their effors in the UK marketplace.

> Do you have Amiga's near?

"Near"? As in, "right next to me"? No, I don't. But I have several friends with Amigas of various configurations, including an A4000.

> The DSP is not used on that Mac AV for rendering. It's used for
>speech recognition, modem emulation and other things....

Not for rendering, true, but it's very useful when accessing (reading and/or writing) video sources.

> I found it very hard to believe too. But let me tell you that LightWave
>was at least 3 times faster than Real 3D... but then I admit, it was a

I would have to say that _I_ like Processor Direct, but I'm kinda biased. You'll have to judge for yourself. I think its first issue looks better than the most recent issue of Current Notes, so that's a useful comparison. I don't know anything about ST Informer, and I refuse to buy from them ever since I heard about what they did to PD's box of flyers at the last Glendale Atari Fest.

So let me get this straight...Your main annoyance with the Mac is the *disk drive*?!? You're one of those people who would turn down a $100,000 prize because it was delivered in singles, aren't you? Talk about nitpicking...And besides, AS I SAID, it's not as annoying as you may believe it is. IMO, the 1040ST's obnoxious side-loading mechanism (which has cost me two mechanisms already) is far more annoying than the Mac's drive.

> My friend had this problem in 1990. I guess times they are a-changin.

If your friend had that problem in 1990, I think he may have been living in 1984. Newsflash: Very little of yesterday's technology interfaces with today's equipment successfully. (See my "upgrading discussion" from several weeks ago for details.)

>I guess you scared him away. You must have sacred sinclap away also; I

> Mac clone market. I don't think that they will ever endorse
> PReP (assuming that that becomes a standard) either.

Dunno about PReP; haven't been following that aspect of Apple. I guess it boils down to a simple issue: You can have a wide-open machine with the resulting mess of conflicts, incompatabilities, and ten thousand "standards" for a given system (there's what, seven types of graphics on the PC now?), or you can have a fairly tightly controlled machine with a unified set of standards, interfaces, and ways of doing things. I don't like conflicts, so I'll stick with the latter.

> What PC clone maker are you referring to? Compaq? Dell?

Actually, I was referring to flea market prices. I could pick up a nice 486 machine, fully loaded with 4-MB RAM, 120-MB hard drive, 14" SVGA monitor & card, keyboard, mouse, dual floppies (3.5 and useless 5.25), DOS and Windows for about a grand. I could also buy a 68040-based Mac with twice the RAM and only one floppy, plus an inkjet printer and 14" monitor for roughly the same price, maybe $100 more, tops.

>Real computers use punch cards. :)

Real computers have to recode everything. All hail the 2600 computer! ;)

I've *never* considered DMA to be a blessing. And *Mac* owners make
errors? Clue #1: I'm also an Atari owner. Clue #2: No Mac produced in the
past six years or so has needed an interleave lower than 1:1 - that's an
error of YOURS. Clue #3: There have been coprocessors in Macs for almost
the same amount of time.
And as a sidenote, I'd gladly give up my ST's DMA port for the
convenience of a decent SCSI controller, which the Mac has had for many,
many years.

> press release a few days ago and was surpriosed that the original PPC
> dissipates 8 watts.

Well 8 watts was not too bad. What's a 25Mhz '040 dissapate? <grin>

Consider that the slower Pentium came in at _twice_ the heat (16W).

Generally the more transisters or the higher the clock the more heat. PowerPC has done pretty well about getting screaming fast performance and staying fairly cool.

> It's very difficult to get rid of that much heat.

Naw, a good heat sink will do it. Pity the Pentium with 16W who must put a mini fan directly on the CPU!

But of course, the cooler the chip the less expensive the machine can be due to lower power requirements and cheaper ways to keep cool.

I'm looking forward to the 100Mhz PowerPC 601 'cause 4 watts is cooler than even the '040 is. And it's almost twice as fast as the '060 is.

Source record: 17367

Ummmmm..... didn't hear about the Atari Fest flyers incident.
They didn't publish anything about it in ST Informer :-). From
my experience Rod MacDonald (the publisher) is a pretty nice guy.
However when I wrote for them I was angry because they re-typed
my article complete with grammatical errors. They also added in
a piece of info in my interview with Hand Made Software which
was false (Philips does not make the 3DO!). But I don't want
to make this sound like a flame. ST Informer does a great job getting
out Atari news on time.
I'll buy a copy of Processor Direct from Toad when I can. I'll
post my thoughts. Good luck with future issues, Tim.

I thought this was advocacy. I have had positive response through E-mail from
users who have said " So little money for so much". In the future I will
refrain from doing this unless Apple announces a $1000 PowerMac.

If Apple was a one product/one model like Atari, your assertion would be true.
Apple has such a broad product line with porducts with low, medium and high
margins. Apple's upcomming May intro of the BlackBirds is an example of a high
margin product that will sell very well.

Have you also checked out how much an Amiga 4000 costs in terms of price/performance to a PowerMac 6100. J&R Computer has em for $1499 now, a drop of $100 from last week. I understand that Amiga video software companies are bailing out of the Amiga market.

Apple is:

1.still restructuring.
2.in a product transition
3. forgoing profits short term for higher marketshare
4.Analysts who follow Apple state that the company will bounce back to the
traditional profitability in the next quarter.

5. Again, the software is cheap. Get A MACWAREHOUSE CATALOG!

When they finally do, they will. But explain how come I have gotten over
4 upgrades of Real 3D V2 (including a major upgrade) since I bought it,
how come NewTek released the Toaster Flyer, Imagine's coming out, Caligari
has been improving, Aladdin is still #1 for gases and is having upgrades, etc.

Of course, you can't, because from your previous posts you just don't
know this market.

|> > software... Tsk tsk... But then, I admit that for general purpose
|> > uses, that Mac offer surely looks interesting (not for me though).
|>
|> An honest comment. Now that AAA is not comming, what is your future hardware
|> plans?

While 'AAA' can still come out, I'm not holding my breath for it.
I was very interested in considering jumping to a PowerMac, until the
animation software, OS speed, current PowerPC implementation (still doesn't
take full advantage), Mac's lack of real multitasking (you pull on a menu,
everything halts), lack of double-buffered animation (well, in the software
I have seen so far and this includes the quicktime movies), lack of a
near-24-bit mode with real-time playback had me reconsidering my decision.
Add to all that, of course, a bit of money for the required AV technologies
(for dumping the signal to video) and the $$$$software price/features.

I might go for a Pentium machine, just because it has games, it's
great for programming (I am a programmer after all), and although expensive-it's
good: 3D Studio (they recently lowered the price on it though).

I tend to like Apple more for having more 'a defined trend' than
the clones in the Video stuff, but still is no way a substitute for the Amiga.

No matter where I'll jump, I know I will be missing a lot of things...
If Real 3D gets ported to a PowerMac that can surely make me reconsider a bit.

So far, I have to wait anyway, but withing a year I should have enough
money to jump platforms...

In some areas, IT IS NOT. At least not for me. And you are forgetting
one more thing: Mac Games in general s*ck. Sure, not all of them, but
they are just a subset of what other computers have. And yes, I like
playing games a lot... if being a 'game machine' is wrong, that's plain
hypocrisy. A good game machine should have good sound, excellent graphics
and be *fast* which is kind of what a computer should be... :-)

This is *ATARI* advocacy. Your message *absolutely* did not belong here.
If you felt the overwhelming need to post it, it should have been done in
mac.advocacy. You're halfway right, however, in your conclusion; you
will refrain from posting that sort of message. PERIOD. Not "unless
Apple announces a $1000 PowerMac." Pro-Apple messages which have nothing
to do with the conversation at hand is simply Atari bashing, and that's
NOT what this newsgroup is for. If, in the future, you do decide to post
a similar message here, I *will* send a message to the administrator of
your site; I doubt I'll have a lot of difficulty finding supporters in
this newsgroup who will back me up.
If you want to talk about Ataris, fine. If you want to answer people's
questions about the Mac, fine. If you want to post pro-Apple messages in
hopes of provoking a silly, stupid CPU war, do it elsewhere.

>But then again I am a fanatical Lynx owner who got screwed! I have owned the
>Amiga 500, 2000, 3000 and A1200 and now a Happy Duo Owner.

So post about your Lynx, then. I'm a VERY long-time Atari owner who feels
I got totally shafted by Atari, too. Do you see me purposely provoking
fights here?

Look, Sinclap, I'll spell it out for you plain and simple.

If you don't like Atari, leave. There's no purpose for you here.
If you want to do nothing but sing about your Mac, do it in mac.advocacy.
If you decide to do otherwise, I will file formal complaints.

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

At last! The truth is finally out! The reason why Peter the Clap hates Ataris and Amigas so much is because he got "screwed" by them. Of course, since he KNOOOWS how LOUUUSY these computers are and how OH! SO GREAT the Mac is, he was STUPID to buy those machines in the first place! Peter, why didn't you just start off with that holy machine, the Mac, and ignore those other computers that you have denounced so many times as being inferior? Judging by your posts, those INFEERIOOOR computers have had a negative effect on your brain.

Just my 2 cents,

Macs as cheap as a flea-market clone? You've got to be kidding. Either
that or Apple is starting a fire sale. In any case, I definitely would
not want to buy Mac this year, even if I was interested in them. This
year you have a choice between the old 680x0 Macs which are being fazed
out, and the new PowerMacs which are still immature and probably won't
even be compatible with Apple's next line of PPC-based Macs much less

Prep.

>Real computers have to recode everything. All hail the 2600 computer! ;)

>>because the CPU is so fast ?
>
>Correct. No PowerPC-based AV machines have a DSP; the PowerPC chip is
>fast enough to handle AV tasks without it, and without affecting performance.
>
>
This is absolute nonsense! ANY coprocessor which is capable of
running concurrently with the main CPU is better than none. If the power
PC systems had a standard DSP integrated into the architecture like the
Falcon then it would be a much better suited to many tasks.

> with the Pentium or a new RISC that can emulate in hardware the
> '486. The later, is what I think they might actually do.
>
> |> goal, then the new Intel chips are pretty good, heat problems aside. With

With respect to the heat problems with the Pentiums I take it that you are referring to the original 60Mhz pentium!
The new pentium P54B, P54C and P54D (66Mhz, 90Mhz and 100Mhz) all run cool, this is due to the fact that Intel have redesigned the chip using 3.3v for the source instead of 5v and 0.6 micron technology in the chips, this means that the 90Mhz Pentium I am looking at purchasing actually runs a lot cooler than my current DX33!

The Power Mac I'm afraid is crap!
I've got the specs of it and the results of tests carried out in several magazines in front of me and it doesn't do too well.
The native mode apps such as photoshop run slightly faster than a 66Mhz Pentium (if you are using the $4500 pound sterling (no symbol on the keyboard - sorry) power Mac and compared to the 90Mhz Pentium they don't even come close!

The floating point calculation is really bad, if theses results are anything to go buy then it can do floating point in a manner similar to a 286 with a co pro! not very impressive!

Frankly I think I've said enough (power Macs just are not worth the time of day) to finish it off I'll just give you the specs of a couple of machines.
Power Mac 8100/80 price 4,500 pounds
8MB RAM

Pentium @ 90Mhz price 2,399 pounds
16MB RAM
twin speed CD drive etc etc
(see Gateway 2000 if interested)

With respect to the new Intel chips
The pentium has been completely redesigned, I can't imagine where you got the idea it

wasn't - it is now a cross between a RISC chip and a CISC chip, it uses superscalar architectire, instruction prediction and parallel processing, this is a major advancement (2 instructions per clock cycle) and anyone who thinks it isn't needs to go
and read the professional computing press!
The pentium also has a redesigned FPU that is reckoned to be the fastest available!

The P6 *HAS* been announced, although it is just a 150Mhz Pentium it's release date is Winter this year.
The P7 has *also* been announced by Intel, this is another version of the Pentium although it isn't supposed to bear much resembence to it as it is capable of eight instructions per clock cycle at 150Mhz (Intel's quoted speed for it) this gives it a processing power of 1,200 MIPS of 1.2 BIPS - expect these machines to retail for arounds 4,000 - 4,500 pounds in Summer 1995

Do apple really think they can compete with this???

Barry

>(I have no local Mac stores).

Falcons have LocalTalk? REALLY?

My point, which I guess I didn't make clear enough, is that while Apple
did "go their own way" with the modem and printer ports, there were
several good reasons for doing so, and that type of port has *become* a
standard in itself - even on the PC. You can buy, for example, an
AppleTalk board for your PC that uses the AppleTalk port - or a 9-pin DIN
port. There's gotta be at least TWO ways of doing things on PCs... ;)

Actually, Atari was part of the lawsuit. Or, more appropriately, Digital Research was. GEM, Windows, and OS/2 were all part of Apple's (stupid) "look and feel" lawsuit; Windows just got the most press since they're the biggest.

Yea, that's a pain sometimes. I've got 16-MB in my machine so I don't get affected by that too much. "True" multitasking w/dynamic memory allocation, btw, will begin to become a reality with System 7.5 (due in a couple months) and will come complete around '96 - at about the same time that all Macs become PowerPC-based. A log time to wait, yeah, but like I said, it doesn't bother me and it doesn't bother a lot of other people.

>(stay calm) You.... The above is a personal, unwarrented and UNTRUE attack!!!
> was willing to give you a second chance, but you blew it with that. I'm
>sorry, but you have no right talking like that. You are a HUGE hypocrite
>and the above proves it.

There is nothing personal or unwarranted about the above, and it's hardly
an attack. And what's so untrue about it? There is NOTHING in that post
that could conceivably be a personal attack on you or anyone else! That's
simple fact. You're heavily biased and fanatical in your loyalism to
Atari; there's a fact, one that you even admitted to a long time ago.
There was TONS of mudslinging going on in the other threads, and you were
part of that (as was I, for a short time). For the longest time, every
time I said "Mac" you went into a frenzy of attacks, accusations and
mudslinging - regardless of the fact that I was keeping a civil
conversation going with other people.

My post proves nothing - and certainly nothing relating to hypocracy.
(Frankly, I don't even understand HOW that could be hypocritical. Do you
even know what the word means?)

>Prep.

No, I'm not kidding. Plain fact. I can buy (I've posted this before) a 25Mhz 68040-based Quadra 605 w/8-MB RAM, a 120-MB hard drive, keyboard, mouse, 360dpi inkjet printer, System software, ClarisWorks (an integrated package, very good) and color monitor for about $1000-$1100. At a recent Ken Gordon show (do you know what that is?), I could have bought a 25Mhz 486SX clone w/4-MB RAM, a 230-MB hard drive, 14" monitor, keyboard, mouse, MS-DOS and Windows for $1000. Tack on another $200 for a DeskJet (300dpi inkjet) and trade the larger hard drive for a 120-MB drive and 4-MB extra RAM and you've got comparable systems - and the Mac has more software, is easier to set up, has a better printer, and has more features (sound sampling, built-in networking, etc).

>* King of the Russians (in Civ)

Again? ;)

>and be *fast* which is kind of what a computer should be... :-)

In general, you're right. Mac games DO suck. Why? SImple. The Mac has no sprites. The Mac was never intended on being a game machine, so sprites (almost mandatory to a good video game) weren't programmed in.
However, there ARE many games which get around that limitation nicely. Maelstrom, a shareware asteroids-type game, is simply incredible. Dozens of other great shareware games exist too; Bolo (a networkable multi-player tank battle game), Solarian II (kinda like Galaxian on steroids), and many many others exist.
On the commercial front, things aren't as populated as some people (myself included) would like them to be. Crystal Quest was the first really great commercial game; the sequel, Crystal Crazy, hit the stores last Christmas. Myst and 7th Guest are great too; the Mac's biggest strengths, I believe, lie in adventure gaming like those two.

>sinclap2954@cobra.uni.edu writes:
>>Apple is:
>>1.still restructuring.
News to me.

>>2.in a product transition
Are they?

>>3. forgoing profits short term for higher marketshare
It's called "business." There's a problem with high marketshare? In that
case, I guess Atari is doing great - they have practically no marketshare.

>>4.Analysts who follow Apple state that the company will bounce back to the
>>traditional profitability in the next quarter.
shrug Not surprising. If you're implying that entry-level Macs will
disappear, however, you're wrong.

>>5. Again, the software is cheap. Get A MACWAREHOUSE CATALOG!
Much of it is, some of it is a bit pricey. But, like I've said, you get
what you pay for.

>6. Makes computers that don't have disk eject buttons.
Closed-minded nitpickers, I swear...

>7. Has lost much of its ease-of-use advantage over the PC cloners
> due to MS Windows.
WRONG! Given otherwise equal platforms, Windows *DOES NOT* make the PC as
easy to use as a Mac. Remember, Windows is nothing more than a shell
running on top of DOS (unless you consider Windows NT, which is a story
unto itself). The Mac OS is a wholly integrated OS. And that's only for
software; hooking up hardware to both plaforms is still far easier on the
Mac.

>8. Refuses to adhere to the PReP standard.
Dunno about this one; I haven't been following it.

>9. Only has a 15% market share.
Compared to Atari's....1.5% share? Pot calling the kettle black syndrome...

>10. Uses non-standard printer ports.
Uses standard printer ports that also happen to double as STANDARD
NETWORKING ports. Would you rather have a computer with an extra port on
the back taking up more space? Sorry.

>11. Won't allow the creation of a REAL Mac clone market
> (read p. 24 of the April issue of Byte)

There's already one company making a Mac clone that doesn't use Apple's technology. Second, Apple's OS now runs on Sun workstations, opening up the potential for other Mac emulators. Third, Insignia Solutions has been licensed by Apple to create a version of the Apple OS that will run on Intel machines.

>12. Will join C= in bankruptcy in 5 years. (*Except* it!)
You have n ofacts to back this up; it's just wishful thinking. And what, for the second time, does "*Except* it!" mean?

>13. Seems to attract idiots such as yourself like flies!
Thank you. Nice to know the community has become so literate.

>Now Mr. Clap, will you please SHUT UP!!
I'm not Mr. Clap. Your point?

>PS: I saw a PowerMac at CompUSA and I WAS NOT impressed!
No surprise there. I saw an $1100 Falcon at a not-so-local Atari store. I was *far* from impressed.

Apparently you don't understand what *Reduced* instruction processors do.
The PowerPC chip, like it/accept it or not, is fast enough to handle all
standard Mac functions as well as DSP functions without adversely
affecting performance.

2097. CFN's Jaguar Vote--most wanted games for the Jaguar! Vote!

Newsgroup: comp.sys.atari.advocacy
Date: 1994-04-28 16:50:40 UTC
From: xx004@cleveland.Freenet.Edu
Message-ID: <2poph0$dnv@usenet.INS.CWRU.Edu>
Source record: 17293
Cross-posted to: rec.games.video.atari,rec.games.video.classic,rec.games.video.arcade,rec.games.video.misc,comp.sys.atari.advocacy,comp.sys.atari.st,alt.games.lynx

If you haven't downloaded the latest version of CAIN Newsletter, here is
your chance to participate in voting for the most wanted games for the Jaguar!
The results will be looked at by Atari Corp. This vote is being done by
the Cleveland Free-Net Atari SIG.

Most Wanted Games on the Jaguar!

Here's your chance to determine the most wanted games on the Jaguar!
If you own a Jaguar or think you will own a Jaguar in the next year or so,
you are allowed to vote on the most wanted games for the Jaguar!

INSTRUCTIONS: You may use 20 points to vote on any of the games on the
following list that you would like to see on the Jaguar. The list was
compiled from lists of games that game players throughout the world
contributed since the last CAIN Newsletter. You may allocate as many
points as you want in vote of a game, but you may NOT use more than a
total of 20 points. If you use more than 20 total points, none of your
votes will count.

If there is a game that you would really like to see made for the Jaguar
but it is not on the list, you may add that game to your votes. But you
are required to give that game at least 10 of your votes.

EXAMPLE:

Mortal Kombat II.....Acclaim/Midway.....[06]
Sinistar.....Williams/Midway.....[03]
Archon II.....Electronic Arts.....[01]
Dimensions Through Space (made up).....Dimensions'R'Us.....[10]

NOTICE: The game that isn't on the list is Dimensions Through Space.
This game does not exist but the game that you would like to see should
exist. 10 points were given to that game since it was not on the list.
This system is to assure that games not on the list will still have a chance
to be a most wanted game (especially if others suggest it too). Also,
if you add a game, you need to include the company that has the rights to
make it.

As you look through the list, you may find errors. If you find an error,
please include information on the error along with your votes.

We are unaware (and most others) of who has the rights to certain Atari
games--Atari Games Corporation or Atari Corporation. If you are aware of
who has the rights to the game, please send the information to the

address along with your vote.

I have been assured by a representative of Atari Corporation that the list of most wanted games will be given to the appropriate person at Atari Corp. after all votes are counted.

Finally, it should go without saying that all of the older games listed would be enhanced versions of the original for the Jaguar.

>search around for a paperclip and unbend it. I'd rather just pop it out look,
>and pop it back in. THis is onw example, I can give you others.

There's no need to pop out the disk and check. A simple glance at the
floppy's window will tell you if it's locked or not. If you're in a
program and at the standard Save File dialog box and you attempt to save
to a locked floppy, it will tell you. Just click on the eject
button, slide the write-protect tab, and put the disk back in. There's
maybe a three second time difference in the latter case, and in the
former case, the Mac's window is faster than ejecting and reinsertng a
disk. (There's also several shareware programs that will change the
floppy's icon to indicate if it's locked, saving even more time.)
If you want to give more examples, knock yourself out. Personally, I
still find it amazing that people are actually whining about a friggin'
floppy drive.

>The point is that you still have to make sure that they are "mac-compatable"
>printers. I can get just about any printer and it'll work. At worst for the
>Atari side, it is just as easy to find a printer for the Atari than for a Mac.

And AGAIN I say (doesn't ANYONE read my messages any more?) that finding
a "Mac compatible" printer is just as easy as finding a PC compatible
one, with the exception of dot matrix printers. I'd be willing to wager,
in fact, that there are more high resolution printers out there that have
either Mac-type or PC-and-Mac-type ports on it than there are printers
that have PC-type ports ONLY. A Centronics connector *hardly* warrants a
high technology, reliable interface. Just because Centronics came before
AppleTalk (aka LocalTalk) doesn't mean that it's better!

>but DMA was faster than SCSI. That was the point of going with it.

And IDE, I believe, is also faster than SCSI. (Or is it MFM or RLE? I
always get those "PC standards" confused.) None of them, however, offer
the type of reliability and convenience that a good SCSI controller
offers. The Mac's strongpoint is ease-of-use, which is why SCSI was chosen.

>I guess I missed it, but don't worry about explaining it. Apple has always
>gone with different ports just for the sake of being different. How else
>can you explain option and command as opposed to control and alternate on the

>keyboards? They just wanted to be different.

There's an ill-informed response if I'd ever seen one. Please show me your proof that Apple's reasons are "just for the sake of being different." I'd love to see them.
The Mac's OPTION key doubles as the PC's ALT key; if you bothered to look at a Mac keyboard (which you obviously haven't), you'll see that "alt" is written on the key cap just as "option" is.
When the Mac was introduced, it had one non-extended keyboard. This was to continue up until the introduction of the Mac SE, when Apple introduced the ADB (Apple Desktop Bus) interface for keyboards and mice, which continues to date. Apple didn't want their computers to be viewed as another sort of PC clone, so they brought it as far away from PC-dom as possible. This precluded removal of the CONTROL key in exchange for a "Mac-like" COMMAND key. Apple did make the mistake of underestimating the general population's need for a PC-like CONTROL key, so when the ADB Macs came out, an extended keyboard was offered (and still is) that has a CONTROL key on it as well.
If you insist on arguing problems that were laid to rest about seven years ago, do let me know. It's mildly amusing.

>Right. you need a plug that costs more than $10 to convert the 15 pin in 3
>to the 15 pin in 2 rows for it to work on a mac. Again, at worst the Mac is
>no more convenient than an Atari.

Boy, are YOU into bad information.
Every Mac produced today that can support SVGA monitors *includes* the adaptor plug with the computer. At no charge. Furthermore, you conveniently bypassed the modem issue. The Mac can use every PC-type modem around; just buy the cable. This is no different from any other computer, however. If you buy the modem, you buy the cable. Sometimes modems come packaged with cables and software. On the Mac, this is fine; dozens of vendors including US Robotics, Hayes, Supra, Boca, and others offer "Mac-compatible" modem/cable/software bundles. Where, praytell, are the Atari modem/cable/software bundles? Sure, you can buy a PC modem package, but then you trash the software. That's convenient, I'm sure.

>"Rather major programming task" = hack. Spectrum 512 is a hack. Video
>interrupts on the 8 bit was a hack. Today, it appears with SM3 to not be
>a hack.

sigh I tire of this.
Major programming DOES NOT constitute a hack. It constitutes a programming effort, period. A "hack" is a programming trick that allows a computer to do something it's not supposed to be able to do. If video interrupts on the 8-bit was a hack, then why did Atari program it into the ROMs of the machine? Why did they allow even lowly BASIC to access it? The same goes for Spectrum 512.
Mortal Kombat II is a major programming task. It is FAR from a hack.
Stereo sound is, and never was, a hack. It just took time to implement.

>No, I'm not saying "incapable" but I do say that my 4Runner is not a car
>that is made for going over 100 mph. A Ferrari, OTOH, is. Your Mac is
>not incapable of doing stereo before SM3, it was not intended for stereo,
>though. (please do not equate that I am saying my falcon is a ferrari and you
>mac is a 4runner... I haye computer/car metaphors)

(Case understood; no erroneous equations made. 4Runners are cool, btw.)
I think "intended" a bad word to use. Certainly stereo sound WAS
intended; otherwise there would be no stereo output on the computer.
Picture it like this: Pre-SM3, accessing stereo sound was akin to hooking
up a car stereo "the old fashioned way" of stripping, soldering, and
taping (or heat-shrinking) several wires for power, ground, speaker
leads, etc. It COULD be done, but it wasn't that convenient. Today when
you install a stereo, you just have to plug in a wiring harness and off
you go. SM3 is like that. Rather than accessing a bunch of different
areas of the Mac to code for stereo, you have one centralized "harness"
that access all of the proper "wiring".

>just like you are avoiding the fact that you are on shaky ground with your
>"I don't atrtack anyone" claim??

I never said that I don't attack anyone. I said I didn't attack anyone
who didn't attack me first. Big difference, and there's nothing shaky
about it.

Keep prices high!! Care to elaborate? I paid $299 for my StyleWriter II. Was I ripped off? Apple Sells a level 2 postscript laser printer for $899($749 my price). Is that too much? HP and other printer companies have Apple Talk ports on their products. I suggest you keep up on the facts before you comment again.

The PC will never have ease of use like the Mac. Remember Apple is not
standing still. There are many reasons to buy a Mac over any PC. What captive
market? Please elaborate? A Mac Quadra 605 8/160 can be had for $869 now?

The question is can you get an 040/40mhz Amiga? If so, how much?

Apple Computer visited my campus today and showed the PowerMac. The Powermac 6100 is fast and blew away a Quadra 800! The surprising part is that the 6100 is much cheaper than the Q800 and 650!!

It must be a contagious decease running in Skoene.. First Kocken buys an old
286, and now you trade your Falcon for a 486.. Who's next? +)

I just read that RATSoft _probably_ will be capable of LAN networking in the
future, so maby you shouldn't sell all your horses and buy goats for the money.

Sounds like a desparate rabid Amigadroid who got the wind knocked out when he
heard that C=USA will close Friday(yes tommorrow).

Ripp off customers? Are you referring to C= for charging $2300 for an Amiga
4000. The Quadras are not much cheaper than the powerMacs. A powerMac 6100
can be had for $1500 versus $1900 for a Quadra 650. However, A Quadra 605 8/160
can be had for $869. So tell me where can I get a 040 Amiga for that much?

Put away your flame throwers, folks. This is a geniune query.

On one of the other Atari newsgroups, someone had mentioned that there was an interview with Sam Tramiel in the San Francisco Herald (?) in which he stated that Atari was, for all intents and purposes, out of the home computer business. Can anyone confirm or deny the existance of thise story?

(Please note the phrasing of my question. I'm not asking if Atari is still making computers or not, I'm asking if someone can provide me with confirmation that Sam Tramiel said this in the aforementioned interview.)

It's a sad day in cyberspace when you have to double-qualify everything you post before the vultures get to you...

2106. Uhm, excuse me ...

Message-ID: <2ppndv$cnn@news.dmpe.CSIRO.AU>
Source record: 17302

Until I started reading this newsgroup last week, I thought that we were trying to advocate the atari range of computers here. Sure they have their downsides like all computers, but why has the discussion divulged into a Power-Mac advocacy group!?

And while I have your attention, can someone point me to how I may plot pixels on a Falcon/ST/STe in assemble!? I wish to be able to set a pixel at x,y in a color. I know this is relatively easy in the chunky true-color, and harder in planar modes, but how the f%$k do I do it in assembler!?
I wish to write a flight sim, have all the theory, and C++ code, but I need to be able to do direct screen plots for the graphics. Someone suggested I use line-a, but as that's a big no-no .....

Any help greatly appreciated ...

Regards,

Karl.

There has been a lot of disagreement about this. But, as far as
I know, Atari's official stance is that Jaguar profits will be
funneled into the computer business. You can argue about whether
this will happen or not. Atari probably will wait out the Pentium
vs. Power PC war and side up with the winner. I do not believe
that Atari will be coming out with a Falcon040 (my opinion). I
do believe that if the Jag takes off that Atari will redefine
power without the price with a next generation machine. You can
flame me if you want but Atari has done it in the past and the
Jaguar just shows that they have not lost their ability to make
great technology available at low prices.
Atari is continuing to support the Falcon. They are still making
and selling it. They have recently announced that they will begin
their co-op advertising program again to allow Atari dealers to
get some more exposure. Atari UK announced that about 80,000
Falcons have been sold in Europe and I have also heard that
Falcon sales have started to pick up. Atari also removed restrictions
on mail order for the Falcon.

I'm not here to vote -- though I'd like to and probably will -- but
there's a game that I havn't seen mentioned that I"d love to see done on
the Jaguar. And that is Electronic Arts' Racing Destruction Set. I had
loads of fun with that on my 8-bit Atari, creating tracks with tall hills
and low gravity and such ... I think that would be a blast on the Jag.

|> The native mode apps such as photoshop run slightly faster than a 66Mhz Pentium (if
|> you are using the $4500 pound sterling (no symbol on the keyboard - sorry)
|> power Mac and compared to the 90Mhz Pentium they don't even come close!

But what Power Mac are you comparing? The one with an 80Mhz Power PC or the low-end
60Mhz Power PC? We have of course, take into consideration pricing, but then
I know prices will differ as I will quote U.S. prices... I'll let you know.

|>
|> The floating point calculation is really bad, if theses results are anything to go buy
|> then it can do floating point in a manner similar to a 286 with a co pro! not very
impressive!

WHAAAAAAAAAAAAAAAAAAAAAAAAAAAAT? NO WAY! I'll check some benchmarks and post them...

|>
|> Frankly I think I've said enough (power Macs just are not worth the time of day) to
finish it off I'll just give you the specs of a couple of machines.
|> Power Mac 8100/80 price 4,500 pounds
|> 8MB RAM
|>
|> Pentium @ 90Mhz price 2,399 pounds
|> 16MB RAM
|> twin speed CD drive etc etc
|> (see Gateway 2000 if interested)

OUCH! Ok, that a nice price difference :-) Like I said, that should be over there,
I'll let you know over here :-) Not to be arrogant, I guess then all will depend
where you live :-)

|> With respect to the new Intel chips
|> The pentium has been completely redesigned, I can't imagine where you got the idea it wasn't - it is now a cross between a RISC chip and a CISC chip, it uses superscalar architectire, instruction prediction and parallel processing, this is a major advance|> ment (2 instructions per clock cycle) and anyone who thinks it isn't needs to go
|> and read the professional computing press!
|> The pentium also has a redesigned FPU that is reckoned to be the fastest available!

NOT FASTER than the Power PC. It is in floating point, where the PowerPC
precisely *CRUSHES* the Pentium.

|>
|> The P6 *HAS* been announced, although it is just a 150Mhz Pentium it's release date is Winter this year.

???? I understood Winter 1995. I'll double check on Byte....

|> The P7 has *also* been announced by Intel, this is another version of the Pentium although it isn't supposed to bear much resembence to it as it is capable of eight instructions per clock cycle at 150Mhz (Intel's quoted speed for it) this gives it a proce|> ssing power of 1,200 MIPS of 1.2 BIPS - expect these machines to retail for arounds 4,000 - 4,500 pounds in Summer 1995

Interesting... we'll see. After all, INTEL announced the Pentium overdrive
system, which they had to delay immenseley because thanks to the heat problems,
it wouldn't work on 95% of the machines. I do admit, however, that INTEL is
very quick and fast in putting out chips, but we'll see.

|>
|> Do apple really think they can compete with this???
|>
|> Barry
|>

The way you put it- no. On the other hand, I'll double check
some of your posted "facts" :-) (sorry, not a flame)

It can do away without the DSP. Having a DSP, of course, would be better.

When I saw crystal quest and saw my Mac roommates going crazy about it,
that's when I realized how bad were the Mac games... :-| :-)

|> last Christmas. Myst and 7th Guest are great too; the Mac's biggest
|> strengths, I believe, lie in adventure gaming like those two.

I don't think so. I don't think the Mac has game strengths after all
(so far). For example, those two games are on the PC too. What other
games the Mac has? Like I said, a subset.

And just in case, if the explanation that why Mac games suck is
because lack of sprites, then I'll say - TOO BAD. That's an explanation,
and I know it too. But it's a reason why I said what I said :-)

One of the very few games on the Mac that I recognize is very good,
has good sounds, atmosphere, etc. is Beyond Dark Castle 1 and Beyond
Dark Castle 2 particularly. Those programmers surely are geniouses :-)

(*sigh* Repetition #9881672367 coming up...)
I understand that wholly. Can YOU, however, understand the reason for my
Mac-ish posts? If people post something about the Mac on this newsgroup
which is in error, I (or someone else, probably) am going to correct it.
This is a bad thing? I don't think so. Anyone here would likely do the
same thing in a Mac newsgroup if someone posted something about the Atari
that was untrue (assuming, of course, that they read the newsgroup).

>Could you please move ALL your discussions about Mac's away from my sight,
>(this means away from all Atari newsgroups), thanks!

Sure, as soon as people (a) stop asking me Mac-related questions, and (b)
stop making false, half-true, misleading or erroneous statements about
the Mac.

>still find it amazing that people are actually whining about a friggin'
>floppy drive.

Anything revealed through software is prone to bugs, I've seen it happen.
Looking at the disk is not. And the drive is just one among many mac-peeves
that exist. I could list them all, but it simply is not worth it.

>And AGAIN I say (doesn't ANYONE read my messages any more?) that finding
>a "Mac compatible" printer is just as easy as finding a PC compatible
>one, with the exception of dot matrix printers. I'd be willing to wager,

Not necessarily true. There are stoeres that do not sell mac things.
Personally, I don't care how easy it is to find a printer for a mac, since it
is equally easy tofind one for my Falcon.

>>but DMA was faster than SCSI. That was the point of going with it.

>And IDE, I believe, is also faster than SCSI. (Or is it MFM or RLE? I

No, IDE is much slower than SCSI.
>always get those "PC standards" confused.) None of them, however, offer
>the type of reliability and convenience that a good SCSI controller
>offers. The Mac's strongpoint is ease-of-use, which is why SCSI was chosen.

Well, I never had a problem getting a HD for my old STs... buy an Atari drive,
plug it in, and go with it. If you want SCSI on an older one, get an
ICD link (under $100) and plug in any SCSI.

>>I guess I missed it, but don't worry about explaining it. Apple has always
>>gone with different ports just for the sake of being different. How else
>>can you explain option and command as opposed to control and alternate on the
>>keyboards? They just wanted to be different.

>There's an ill-informed response if I'd ever seen one. Please show me
>your proof that Apple's reasons are "just for the sake of being
>different." I'd love to see them.

A quote from a former Apple employee "The reason the cloverleaf shape was chosen for the command key is that they searched and found that the only other use for that symbol was for "campground" in the netherlands" (something to that effect) Apple has always wanted to be different than what was conceived as the "oppressive" PC standard (remember the 84 mac introduction commercial?) They wabnted to be the "rebel" computer, trying to be two guys in a garage image forever... Well, that was a while ago. These days they've lost that integrity and are just another oppressive megalithic company.
>The Mac's OPTION key doubles as the PC's ALT key; if you bothered to look
>at a Mac keyboard (which you obviously haven't), you'll see that "alt" is
>written on the key cap just as "option" is.

Please stop insulting me. How many times must I say that I did customer support and technical services for a Mac software company? I know that on recent keyboards they have added the control key and an escape key and things to make it more "standard" that simply shows how far they've fallen from their original ideals.
>When the Mac was introduced, it had one non-extended keyboard. This was
>to continue up until the introduction of the Mac SE, when Apple
>introduced the ADB (Apple Desktop Bus) interface for keyboards and mice,
>which continues to date. Apple didn't want their computers to be viewed
>as another sort of PC clone, so they brought it as far away from PC-dom
>as possible. This precluded removal of the CONTROL key in exchange for a
>"Mac-like" COMMAND key. Apple did make the mistake of underestimating the
>general population's need for a PC-like CONTROL key, so when the ADB Macs
>came out, an extended keyboard was offered (and still is) that has a
>CONTROL key on it as well.

The new extended keyboards are not the same as the old ones... the feel has been shot to hell and is incredibly spongy like the Falcon keyboard that everyone was complaining about... luckily they seemed to have fixed it with the first run of Adjustable keyboards (I used one... I will give Apple credit for stealing a nice idea there... Any news on the lawsuit from the guy who made it originally?) I don't know if they screwed it up since then. I haven't used a new mac since July '93
>If you insist on arguing problems that were laid to rest about seven
>years ago, do let me know. It's mildly amusing.

>Boy, are YOU into bad information.
>Every Mac produced today that can support SVGA monitors *includes* the

Okay, that might be true today. As I said above I have not used a new mac since july 93. they were not doing this then.

>adaptor plug with the computer. At no charge. Furthermore, you
>conveniently bypassed the modem issue. The Mac can use every PC-type

I bypassed the modem issue because it is irrelevant. I know you can just buy a cable. I'm not talking convenience here, I'm talking the reason they went with a different port in the first place!

>modem around; just buy the cable. This is no different from any other
>computer, however. If you buy the modem, you buy the cable. Sometimes
>modems come packaged with cables and software. On the Mac, this is fine;
>dozens of vendors including US Robotics, Hayes, Supra, Boca, and others
>offer "Mac-compatible" modem/cable/software bundles. Where, praytell, are
>the Atari modem/cable/software bundles? Sure, you can buy a PC modem
>package, but then you trash the software. That's convenient, I'm sure.

Actually, since compared to ST modem software most PC and Mac software is
pretty much crap anyway, trashing it is a kind thing to do.

>*sigh* I tire of this.
>Major programming DOES NOT constitute a hack. It constitutes a
>programming effort, period. A "hack" is a programming trick that allows a
>computer to do something it's not supposed to be able to do. If video
>interrupts on the 8-bit was a hack, then why did Atari program it into
>the ROMs of the machine? Why did they allow even lowly BASIC to access
>it? The same goes for Spectrum 512.

Atari admist Spectrum 512 was a hack, which is why they did no efforts
to try to support it in future machines. THere's nothing bad inherently
in hacks, they just are not widely used.

>Mortal Kombat II is a major programming task. It is FAR from a hack.
>Stereo sound is, and never was, a hack. It just took time to implement.

doing MKII on a mMac (or a Falcon) would require some serious hacks.

>(Case understood; no erroneous equations made. 4Runners are cool, btw.)
>I think "intended" a bad word to use. Certainly stereo sound WAS
>intended; otherwise there would be no stereo output on the computer.
>Picture it like this: Pre-SM3, accessing stereo sound was akin to hooking
>up a car stereo "the old fashioned way" of stripping, soldering, and
>taping (or heat-shrinking) several wires for power, ground, speaker
>leads, etc. It COULD be done, but it wasn't that convenient. Today when
>you install a stereo, you just have to plug in a wiring harness and off
>you go. SM3 is like that. Rather than accessing a bunch of different
>areas of the Mac to code for stereo, you have one centralized "harness"
>that access all of the proper "wiring".

eek. more car metaphors. I don't really buy this, because so few people
actually did this that it is not significant to the presebntation of the
Macintosh. (i.e. "Buy a mac and get stereo sound if you do this and that and
the other and the rare program that figures out how to do it right and then
sometime it'll work" just does not make good advertising copy. I think the
fact that I've known hundreds of Mac users, worked with many well-known
applications and have never seen the mention of stereo until you came along
says something)

>I never said that I don't attack anyone. I said I didn't attack anyone
>who didn't attack me first. Big difference, and there's nothing shaky
>about it.

I see. Since I attacked you once long ago, this gives you license to continually make insulting remarks to me until the end of time? SOunds like you need to calm down a bit...

I guess I'm somewhat to blame for mentioning the fact that Bob Brodie made a comment to the effect of "Are you sure you want us to go with the PPC? THe new pentium chips look pretty good on paper" (He was rteferring to the second generation pentiums)

Anyways, based on the pro Pent post, I think the point I was making is valid, which is simply that the PPC is not necessarily the winner. If the pentium is used properly (i.e. not attempting to be compatable with 286 code) then it can be a very good chip. THe next gen of chip wars is only starting, and there is no clear winner in sight. I say again that Atari is lucky in a way, since they have so little money to spend on computer development, they can wait out the first few rounds before deciding which side they are supporting,.

THere have been lots of ambiguous statements concerning this that could be interpreted as Atari giving up by thoe who want to read it that way. There are talks of "transition to making video games" (not meaning that they are giving up computers, but fopcusing primarily on Jag for now) and a reference to Jack Tramiel "backing out of the computer business" (he is out for most intents and purposes, but his sons are still there)

THat and the fact that most media do not know about ATari computers often paints a bleak picture. Atari has, when questioned directly, always said that they intend to continue making computers.

|> which he stated that Atari was, for all intents and purposes, out of the
|> home computer business. Can anyone confirm or deny the existance of thise
|> story?
Basically, Atari are a small firm. They have no hope in hell of ever being
anything big in computers - just a cult sort of machine. They know that and we
know that. Accordingly, they have gone back to their roots and released the
jag which will hopefully make them lots of money. They do still make Falcons
and TTs and occasional runs of STs (they currently have about 10,000 on back
order in Europe). They don't currently have the resources to concentrate on
getting the Jag the market share it deserves. Accordingly they have stated
that they will look at the computer situation about August and decide whether
or not to continue production. They may conceivably stop and restart later but
if I was them, I would only do this if I had a killer machine that could carve
a niche. In the meanwhile, the people who work on the OS and fonts technology
at Atari now work on the Jag. OS development has been suspended.
In a nutshell then, they still make computers but are looking hard at the
economics of it. they have stated however that they will support the computer
line until 'the end of the millenium'. They have confirmed that they have an
040 based falcon but whether or not it will be released is another matter.
It's just simple economics - like it or not, the PC and to a lesser extent Mac
pretty much rule the roost and there isn't a thing Atari can do to break that
stranglehold.

|> It's a sad day in cyberspace when you have to double-qualify everything
|> you post before the vultures get to you...
Don't worry, as Mac advocates go, your one of the best behaved. I have *no*
intention of flaming you :-)

In true color mode this should work:

move.w #2,-(sp)
trap #14 ;get physbase
addq.l #2,sp
move.l d0,a0

moveq #100,d0 ;x-koodinate
moveq #100,d1 ;y-koordinate

mulu #320*2,d1 ;bytes per scanline
mulu #2,d0 ;bytes per pixel

add.l d0,a0 ;add offset to screen-address
add.l d1,a0 ;add offset to screen-address

move.w #COLOR,(a0) ;plot pixel

/
/ Daniel
```

Have I accidentally walked into the comp.sys.mac.advocacy or comp.sys.atari.bash newsgroup or something? All I see here are Mac vs. Atari and just general messages about Macs here. I know a number of other people have suggested it, so I thought I would add my own vote here: LET'S CUT OUT THE MAC CHAT! As far as I'm concerned, in *this* newsgroup, if it isn't about Atari, it's a waste of bandwidth. I don't care about new Quadra pricing. I don't care about Macs in general. Or PCs. Or Amigas. I own an Atari and that's what I want to read up about. If I wanted to read up on the latest Mac, Amiga or PC developments, I'd go to those respective newsgroups. When I come in here, I expect to see conversations about Atari. Not flamebait posted by Mac loyalists or PC fanatics or whathaveyou. That's *not* what this forum is for.

So let's clean up the act, huh?

Ricardo Hernandez (raist@rmece02.upr.clu.edu) wrote:
:# The PC doesn't have sprites. Yet, while their action-scrolling games
:#suck, there are other games that are really good (DOOM comes to mind :-)).

I think something like DOOM could be written for the Mac. I think the ID guys don't like Apple...8-).

:# When I saw crystal quest and saw my Mac roommates going crazy about it,
:#that's when I realized how bad were the Mac games... :-| :-)

I've seen some bad games on the Mac and I've seen some decent games also. Spectre on the Mac was a very well done game. So, it is possible to get good games on the Mac, but whether or not it's worthwhile for the game developers to produce games for it is something else. Piracy on the Mac is affluent as any other market, but it has the added disadvantage of a smaller market than the Clone market, but a market that wants everything to run via the OS. A game that doesn't run via the OS will not sell well at all in the Mac market but, it doesn't have a large enough user base to help offset the amount of piracy that would happen if it unprotected, whereas the Clone user base is so large that any good game will sell even with piracy.

:# One of the very few games on the Mac that I recognize is very good,
:#has good sounds, atmosphere, etc. is Beyond Dark Castle 1 and Beyond
:#Dark Castle 2 particularly. Those programmers surely are geniouses :-)

When I first saw DC 1, I really didn't think they were that great. Damn, I must be one of a few that didn't enjoy DC. Come to think of it, I don't think I remember any really good games at all for the Mac at the time. Well, nothing that surpassed my C64 at the time...8-).

One point that I would like to make about the Mac drive....
What happens if the computer doesn't register a disk being
inserted? I have had this happen to me two or three times
on a Mac SE and the only way to get the disk out (without
prying it out) is to reboot (AFAIK). I'm not saying that this
problem is commonplace but it did turn me off to the Mac's disk
drive. No, Steve, I'm not making this into a big deal (I hope)
just trying to add to the discussion :-). If you don't know by
now I like Macs, but just like my Atari more :-).

I never realized that! Wow!! Yet another good reason not to buy a Mac.
That's one of the dumbest design decisions I've ever heard of! Make it
impossible to make good video games!!!! Yuck! That's almost as bad as
the disk eject button omission. Of course, to be fair, PC's aren't
really great game machines either. Take the sound for example: the
sound of my 386 is inferior to the sound of amy ancient Atari 800. Go
figure.

aspect@cats.ucsc.edu (Christopher Taylor Oates) writes:
>Anything revealed through software is prone to bugs, I've seen it happen.
>Looking at the disk is not. And the drive is just one among many mac-peeves
>that exist. I could list them all, but it simply is not worth it.

Oh, PUH-LEEZE! Y'know, I really don't believe you. First you come up with
a niggly little gripe (the floppy drive), which I explained the flaw in
your rationale. Now you're implying that a bug could appear at any moment
and show that a disk is locked even if it isn't, or vice-versa. You're
REALLY grasping at straws, Chris. But you are correct in the regard that
it's not worth getting into, as everything I explain to you will
invariably be nitpicked apart to itty bitty pieces.

>Not necessarily true. There are stoeres that do not sell mac things.
>Personally, I don't care how easy it is to find a printer for a mac, since it
>is equally easy tofind one for my Falcon.

Correct, there are stores that don't sell Mac things. And as I said, and
as you obviously didn't pay any attention to (big friggin' surprise), the
vast majority of high resolution printers that have PC-type connectors
ALSO have Mac-type connectors, so even though the store may not "admit"
to selling Mac stuff, they do. I've seen this sort of thing dozens of
times. And I've never said that it wasn't easy to find a printer for the
Falcon; I wish I knew where you came up with some of these implications.
It really makes it very difficult to converse with you when you're trying
to implicate meanings other than what I mean into what I post.

>A quote from a former Apple employee "The reason the cloverleaf shape was
>chosen for the command key is that they searched and found that the only
>other use for that symbol was for "campground" in the netherlands"
>(something to that effect) Apple has always wanted to be different than
>what was conceived as the "oppressive" PC standard (remember the 84 mac
>introduction commercial?) They wabnted to be the "rebel" computer, trying
>to be two guys in a garage image forever... Well, that was a while ago.
>These days they've lost that integrity and are just another oppressive
>megalithic company.

The COMMAND key's symbol comes from some sort of campground brochure in
England somewhere, and (according to the brochure, the story goes) it
means "Interesting Attraction" or something like that. The symbol was
chosen *strictly* because Apple needed something to symbolize the key in
their menus and documentation, rather than having the word COMMAND
written all over the place.
You're right, Apple ALWAYS has wanted to be different. That's what made
them so great, in case you hadn't noticed. The world was using CLIs,
Apple introduced the GUI to the masses. The world was spending hundreds

of dollars on pathetic networking schemes, Apple introduced the inexpensive AppleTalk protocol which gained widespread acceptance in the business computer industry. Being different, in case you think otherwise, isn't such a terrible thing. The Mac is different enough to be distinguishable from a crowd of also-rans, but it maintains enough similarity to the rest of Computer-Land to be "acceptible" to the masses. Things are different on the Mac, fine. So what? Things are different on the ST as well, as they are on the Amiga, Suns, 8-bit machines, etc. Listening to you, one would be inclined to believe that all machines in the universe should be exactly identical to each other with absolutely no differences whatsoever. Sieg heil, Chris, y'know? Lighten up already.

>Please stop insulting me. How many times must I say that I did customer
>support and technical services for a Mac software company? I know that
>on recent keyboards they have added the control key and an escape key and
>things to make it more "standard" that simply shows how far they've fallen
>from their original ideals.

I'm not insulting you at all. I'm calling your attention to things which you're obviously not well versed in. I remember your claim to being a customer support rep; frankly, I highly doubt you could have been an effective employee considering the vast amount of things you don't know, or are misinformed about, on the Mac.
I rather like your implication that adding the CONTROL key was a "recent" innovation. It shows how heavily biased you are, so very desperate to shed negative light on the issue. This "recent" innovation, as you put it, was introduced about 6-7 *YEARS* ago and in no way whatsoever has any affect on current computing trends. If you care to debate what the computers were like 6-7 years ago, fine, but I have no interest in it. (The ESC key, FYI, was on Mac keyboards *at least* since the Mac Plus, which brings it to about 1985-1986 or so. That's recent? Get with the program!)

>The new extended keyboards are not the same as the old ones... the feel has
>been shot to hell and is incredibly spongy like the Falcon keyboard that
>everyone was complaining about... luckily they seemed to have fixed it
>with the first run of Adjustable keyboards (I used one... I will give Apple
>credit for stealing a nice idea there... Any news on the lawsuit from the
>guy who made it originally?) I don't know if they screwed it up since then.
>I haven't used a new mac since July '93

The *layout* of the new extended keyboards are the same; I agree with you on the feel. I strongly prefer my original Extended Keyboard to the new Extended Keyboard II (as it's called) and, when the time comes for me to step up to a more powerful Mac, my keyboard is coming with me. :) You like that adjustable keyboard? I don't; I find it VERY difficult to type with, and that keypad and function key arrangement has GOT to go. IMO, Apple gets brownie points for introducing a more ergonomically correct keyboard, but they could have done a much better job. (And no, I haven't heard *anything* about a lawsuit; please enlighten me.)

>Okay, that might be true today. As I said above I have not used a new
>mac since july 93. they were not doing this then.

Sure they were. But back then, only two or three (?) Macs supported SVGA
monitors. The vast majority of Mac models back then only supported
Mac-type monitors.

>I bypassed the modem issue because it is irrelevant. I know you can
>just buy a cable. I'm not talking convenience here, I'm talking the
>reason they went with a different port in the first place!

Which I explained, a long time ago.

>Actually, since compared to ST modem software most PC and Mac software is
>pretty much crap anyway, trashing it is a kind thing to do.

I can only halfway agree with you there, as the last ST terminal program
I used was something called "Interlink" (?). It was very good, though a
bit kludgey. I use a program called White Knight on my Mac which is also
very good and has a great scripting language, but it lacks in many areas.
I remember the old "Express!" modem program for the 8-bit. Given the
time, that was an outstanding program. :) Many Mac modem packages these
days include a program called "MicroPhone" or "MacKnowledge"; the former
is decent but *HUGE*, while the latter is almost totally worthless.
Fortunately, there's a great shareware program called "ZTerm" which
thousands upon thousands of users swear by.

>Atari admist Spectrum 512 was a hack, which is why they did no efforts
>to try to support it in future machines. THere's nothing bad inherently
>in hacks, they just are not widely used.

Atari didn't create Spectrum 512; if I'm not mistaken, that was published
under the Antic software title. Atari's insight has little to do with the
program. The point is, the function was built into the machine (at the
time) so it wasn't a hack.

>doing MKII on a mMac (or a Falcon) would require some serious hacks.

shrug On the Mac, probably, since the Mac lacks sprites. Anyone who
programmed MK2 on the Mac would need to write a whole sprite rendering
system, as well as a system of controls. Eew.

>eek. more car metaphors. I don't really buy this, because so few people
>actually did this that it is not significant to the presebntation of the
>Macintosh. (i.e. "Buy a mac and get stereo sound if you do this and that and
>the other and the rare program that figures out how to do it right and then
>sometime it'll work" just does not make good advertising copy. I think the
>fact that I've known hundreds of Mac users, worked with many well-known
>applications and have never seen the mention of stereo until you came along
>says something)

You also tell me that you've been a Mac tech support rep, and based on
what you've been posting to me here, I doubt that was a long-term,
successful job. THAT tells me something.

>I see. Since I attacked you once long ago, this gives you license to
>continually make insulting remarks to me until the end of time? SOunds like
>you need to calm down a bit...

I make no insulting remarks. Perhaps my constant side notes of things like "if you bothered to read my message" every other post are a bit rough, but they're hardly insulting. If you were in my shoes and someone kept asking you the same thing over and over and over again, you'd get a bit ruffled too.

"Hi, what's your name?"
"Chris."
"Cool. What's your name?"
"Uh, Chris."
"Your name is...?"
"Chris. I just said that."
"Oh yeah, sorry. What's your name again?"
<<ad nauseum>>

Get it?

Hmmm. Well, so much for the "non-standardness" that Apple is, I s'pose.

> The PC doesn't have sprites. Yet, while their action-scrolling games
>suck, there are other games that are really good (DOOM comes to mind :-)).

And games of similar nature (i.e., Pathways Into Darkness on the Mac) are really good on the Mac, too. It's those "Sonic-type" games which never quite caught on in Mac-dom.

> When I saw crystal quest and saw my Mac roommates going crazy about it,
>that's when I realized how bad were the Mac games... :-| :-)

Crystal Quest is kind of an acquired taste, like Infocom text adventures. :)

> I don't think so. I don't think the Mac has game strengths after all
>(so far). For example, those two games are on the PC too. What other
>games the Mac has? Like I said, a subset.

I never said that the Mac is a strong game machine; it never was intended to be so. What I'm saying (AGAIN) is that the better games on the Mac are the adventure-type games, like Myst, 7th Guest, Pathways Into Darkness, etc, rather than the arcade-type games, like Mario Brothers or something. That's not to say that there aren't good arcade games on the Mac, just that there are comparatively few of them.

> And just in case, if the explanation that why Mac games suck is
>because lack of sprites, then I'll say - TOO BAD. That's an explanation,
>and I know it too. But it's a reason why I said what I said :-)

You don't hear too many Mac owners complaining, do you? Sprites are a pretty serious handicap (or lack thereof, actually) when programming an arcade game, but it certainly doesn't make it impossible to do so. Like I said before (GADS, AM I TIRED OF #$%^&*(REPEATING MYSELF!!!), the Mac was never designed to be a game machine so sprites were never programmed into it.

> One of the very few games on the Mac that I recognize is very good,
>has good sounds, atmosphere, etc. is Beyond Dark Castle 1 and Beyond
>Dark Castle 2 particularly. Those programmers surely are geniouses :-)

Never played the Beyond Dark Castle games, though I have played the original Dark Castle, which was very good. :)

And we all know where the NeXTstep OS went....

In reality, lots of the most interesting Mac game software came out AFTER
Solarian II came out. Ben Haller kinda demonstrated to the programming
populace, via Soliarian II, that it was possible to make a good Mac
arcade game. Andrew Welch, one of the premier Mac shareware programmers
today, has programmed several commercial quality shareware games.

I did not come up with the floppy gripe. I merely am defending it as one
among hundreds of valid gripes about the mac. And I've seen many problems with
the Mac floppy drives. Someone else mentioned the old not recognizing the
disk on insert. That's happened, as have many other things. Sure, if it never
goes wrong, the auto floppy mechanism can be convenient for someone who is
clueless about computers, but I believe in the Keep it Simple axiom. And it's
not worth getting into because everything I say you reply with "No, you're
too stupid and here's this attack on your character rather than responding to
the question." You simply are not able to contribute antything to th
discussion when there is a situation where you might not be able to be the
all-knowing god of Mac knowledge.

I'm not implicating anything on you! it is _MY_ statement that it is
irrelevant to talk aboput printers since it is just as east to find a mac
as a IBM as an Atari printer. It has nothing to do with you. We are not the
only ones in this newsgroup. I am posting information for everybody, unlike
you, who seems to thrill only in attacking me.

>The COMMAND key's symbol comes from some sort of campground brochure in

>Listening to you, one would be inclined to believe that all machines in
>the universe should be exactly identical to each other with absolutely no
>differences whatsoever. Sieg heil, Chris, y'know? Lighten up already.

Where in the hell did I say that? My point is that being different for th
of being different is not useful, it is just obnoxiousm, like a child
attempting to attract attention. Back in the "old days" when Apple was being
different to the extreme, there was a certain integrity to their machines,
carrying with it a hefty pricetag. Since then they have run out of good ideas
and have retreated to competing on the cheap with CLone makers, and have lost
any integrity they had. It's a complete reversal. From thumbing their noses
at the corporate bigshots defining What A Computer Should Be to sleeping with
them. I have no respect for Apple computer or the machines they make.

>>Please stop insulting me. How many times must I say that I did customer

>it, was introduced about 6-7 *YEARS* ago and in no way whatsoever has any
>affect on current computing trends. If you care to debate what the
>computers were like 6-7 years ago, fine, but I have no interest in it.
>(The ESC key, FYI, was on Mac keyboards *at least* since the Mac Plus,
>which brings it to about 1985-1986 or so. That's recent? Get with the
>program!)

Nope, the Mac plus did not have a control key. I've used dozens of the, nor
the escape key. I used one as recently as 3 months ago, and was trying to get
someone up to speed on a terminal program, which was very difficult without a
control or escape key (most term programs for the mac still support tilde as
a substitute for ther escape key...)

And I take things like "immature" "not an effective employee" to be insults. Maybe they don't affect you, but I can only guess that because you are used to hearing them so much. Andf I won't go into how the company felt about my mac abilities, because it would sound like boasting and you would not believe me anyways, and it is useless information to the rest of the group.

>The *layout* of the new extended keyboards are the same; I agree with you

>Apple gets brownie points for introducing a more ergonomically correct
>keyboard, but they could have done a much better job. (And no, I haven't
>heard *anything* about a lawsuit; please enlighten me.)

All I heard about the lawsuit is that they guy who invented that design of hinged keyboard was suing apple because they stole it from him. I actually liked the separate keypad with the "nub" style function keys. I put the keypad on the left (since I'm a lefty) and set up quickkeys macros to do all kinds of useful things.

>Sure they were. But back then, only two or three (?) Macs supported SVGA
>monitors. The vast majority of Mac models back then only supported
>Mac-type monitors.

Um, every Mac from the LC and up was SUPPOSED to support it... I know that my LCII was supposed to, but when I tried two different monitors on it the screen was messed up...

>I can only halfway agree with you there, as the last ST terminal program
>I used was something called "Interlink" (?). It was very good, though a
>bit kludgey. I use a program called White Knight on my Mac which is also

>days include a program called "MicroPhone" or "MacKnowledge"; the former
>is decent but *HUGE*, while the latter is almost totally worthless.
>Fortunately, there's a great shareware program called "ZTerm" which
>thousands upon thousands of users swear by.

I tried Zterm, but liked a little program called Termulator better because it had a decent scripting language including popup menus & such, which was nice for setting up scripts to get GEnie messages, which was something I was doing for the company.

>Atari didn't create Spectrum 512; if I'm not mistaken, that was published
>under the Antic software title. Atari's insight has little to do with the
>program. The point is, the function was built into the machine (at the
>time) so it wasn't a hack.

THe insight is because Spectrum was the biggest paint program user-wise in its day, and people wanted Atari to support it more with the OS, I believe. Spectrum was not built into the machine, in as far as one could use an OS

call and enter a "spectrum mode". it was very timing dependent, which is why it broke on the TT and Falcon and the MSTE has to be switched back to 8Mhz for any of the viewers to work.

[mortal kombat stuff deleted... not really anything pointful there anyway..]

>You also tell me that you've been a Mac tech support rep, and based on
>what you've been posting to me here, I doubt that was a long-term,
>successful job. THAT tells me something.

Just because you don't like my opinions means I'm a bad support person? Gee, I didnt know you were in charge of the universe.

>I make no insulting remarks. Perhaps my constant side notes of things
>like "if you bothered to read my message" every other post are a bit
>rough, but they're hardly insulting. If you were in my shoes and someone

I hear people raving about X-wing, Tie, and the enhancements left and right.

It would be a shame if the Intel remains the only platform for this. The Jaguar is probably BETTER suited for texture polygon animation than an Intel box.

You could easily do a CD-ROM and have several dozen missions on them, and combine X-wing and TIE together so you can be an X, Y, A or B wing or the various TIEs.

I guarantee you such a CD would make the Jaguar CD system the #1 console in the country overnight.

Of course, the CD isn't out yet, but X-wing is also doable on a compressed CART I'm sure.

JEEEEEZZZZ!!! If you guys don't cut it out, I'm going to stop reading this godforsaken newsgroup entirely, as I'm sure many others have. There is ABSOLUTELY NOTHING useful being posted here. Just more Mac vs. Atari arguements that are getting more and more pathetic and pointless as time goes on. Some of the stuff you guys are arguing about is so absolutely pointless to consider, you should be ashamed of yourselves. Floppydrive button? COME ON! Get real, guys! Who *&%^*$ cares? The last time I popped a floppy into a Mac, it took forever to (automatically, ie, something a PC or atari wouldn't do) scan it for viruses, it took forever to read and write (DOS Mounter), and the wordprocessors CRAWLED, but this had absolutely NOTHING to do with the motor driven eject mechanism!

Again, I will try to start up a more profitable topic. How about we talk about Warp 9, NVDI, and unassisted VDI for doing graphics output on Atari vs. Atari?

How about that Z85c30 SCC chip the STe, TT, Falcon use for serial I/O and how much of a bitch to program it is, except that once you've done that you can do everything from async, to sync, to SDLC/HDLC?

How about terminal programs? Who uses ANSITerm? Who's registered it?

Any good wordprocessors? I think that Atari Works needs SERIOUS work, but the developer won't respond to my GEmail (figures). And that ^&$%$% Control-A for selecting the whole document? I don't know how many times I've deleted my whole document from memory (slowly, line by line (what a joke)) when accidentally hitting Ctrl and A together WHICH ARE RIGHT NEXT TO EACH OTHER! And would you believe that Atari has made this a STANDARD key combination? Someone REALLY needs to be shot. You DO NOT make easy to hit key combinations do dangerous things, and you simply DO NOT make select whole document available from the keyboard AT ALL! I have similar complaints about shift-backspace and shift-delete.

Processor Direct magazine. More articles, cool looking layout, informative ads, 23x13.5 inch center ad space (huge!), full color cover for the first issue. You should see some of the comments people are making about it.... you should compare it to, say, Current notes, any volume over 11, after 1991. And PD is a lot easier on the eyes to read too. We got a BIG surprise for you for the second issue. I'm not gonna tell you, but it's going to be on the front cover and it's HOT! <GRIN!> (oops, I'm not supposed to count our chickens before they hatch, am I... there's about a 5% chance the big surprise won't happen.)

New products coming out... what's hot?

Of Lasers And Men. Has anyone been able to get onto umich to get it? It's not on any of the shadow sites. If the first one was good, the new one is going to be spectacular. Good competitor for DOOM.

Speeking of DOOM, I was in that DOOM conference on GEnie, and I and one other guy (when I was there) asked about a Falcon version of DOOM. We were blown off faster than you can shake a stick. The best they could tell me was a very rudely placed 'Falcon = no money', and the other guys got lots of No's.

I'm out of ideas for the moment. Try telnetting to 138.74.0.10 port 8888. <chuckle>

: power without the price with a next generation machine. You can

The Jaguar would be an excellent backbone for a computer. It's display will support the future HDTV standard for one thing. It could very well take the multimedia world by storm as a kind of new form of Amiga, the NTSC clocking as opposed to VGA scan rates, the 64 bit bandwidth, the RISC.

Unless 2 megabytes of RAM is low for a RISC machine (which it might if software is memory hogging to make up for a lack of opcodes) then you can't merely use the existing archetecture. You'd have to add more RAM.

What I find exciting is the sense of history potentially about to repeat itself. Atari found success with th 2600 and then offshot into the home computer world with the 400/800 which used essentially the next generation 2600 chipset.

The only real thing internally in the jag which prevents it from being a powerful home computer is the clock speed of the CPU. It would make a very powerful low end unit, though. With more RAM and a faster CPU you could really do quite a lot.

Plus, shedding themselves of the ST/TT/Falcon legacy and going RISC, Atari will be able to make their own obligatory Intel emulator software to get over the "will it run Wordperfect 6 for windoze" dilemma.

However, to run clone stuff it would probably need a custom video processor to do VGA. All the Jaguar can do is NTSC scan rate it seems...

But I think personally Atari should not produce an '040 machine. By the time Atari has the money to reenter the computer field, the 680x0 line will have been effectively pronounced dead.

Atari has a winner archetecture with the Jaguar.

Actually, most of what is considered standard keystrokes have evolved from the
Mac. COntrol A for select all is one of them (from command A on the Mac)
It's interesting that I have never had a problem with accidentally hitting
control and A until I got a falcon... must be the bigger keycaps. I still
prefer that over having caps lock in that position... When I've had the
accidental erasure in AW, a simple UNDO has always saved me. :)

>consoles?

Because they're not stupid enough to do to themselves what
Commodore and Atari spent the last decade doing: beating their
heads against a brick wall would be more productive than trying
to re-establish the only remaining sector (<$800) of the computer
market in which a new startup company with low volume could
compete with the clones and the Macs.

Want to see the fate of a company that tries to compete with a
non-standard, overpriced, undersupported machine? Commodore is
in liquidation (finally) and the Jaguar is all that can save what
little is left of Atari after the ST machines practically destroyed
the company by pulling Atari out of the console market (just before
the Nintendo boom--great timing).

Sorry, I doubt there will be any takers.

Here is the code I posted on comp.sys.atari.st for plotting one point on an Atari screen with interleaved bitplanes. This code is not well optimized and overly generic (it will plot to any screen size with any number of pitplanes).

I put up on comp.sys.atari.st so that someone could laugh at it then try to optmimize it. If you want to use this, fine, but plotting a single pixel on an Atari screen is the most inefficient thing you can possibly do. If you want to do graphics, you'll be drawing lines, drawling horizontal spans, and blitting sprites, which are MUCH more efficient than drawing single pixels. I am working on code to draw horizontal spans (converting from the original C code), and it's as efficient to draw a span as it is to draw one pixel, and drawing spans is very useful for polygon fill.

It is all ready to be written to a file and linked into your C program using Lattice C. All you need is a prototype that says this:

```
void plot(void *, long, long, long, long, long);
```

Enjoy!

```
CSECT text,code
XDEF _plot

scr EQU 8 ; 4 Screen memory
x EQU 12 ; 4 X coordinate
y EQU 16 ; 4 Y coordinate
c EQU 20 ; 4 Color
wd EQU 24 ; 4 Word width
bp EQU 28 ; 4 Number of bitplanes

; PLOT to any number of bitplanes
_plot:
link A6,#0 ; link to A6
movem.l D2-D6,-(A7) ; store registers

movea.l scr(A6),A0 ; screen pointer
move.l x(A6),D2 ; x coordinate

I just DO NOT like Intel. They are the worst processors in the WORLD to program in assembly, and I don't want compilers written like Borland C++ that do some of the most moronic things to optimize code. Unrolling loops is good some times, but not to the extent that they do it. If Atari were to pick a processor, they should go to PPC. PPC is already a decade ahead of Pentuim, and the PPC is already getting faster and faster as they go.

A REALLY smart move on Atari's part would be to use some of those chips in the Jaguar as standard in new models of the Falcon. Just imagine what could be done with all that video and audio hardware! One guy at Atari already told me that he thought that would be a good idea... he said that some of the chips in the Jaguar are really neat. Think of the kinds of rendering that could be done at blinding speeds with a PPC, Jag graphics and audio processors, and a 68040 thrown in. (The PPC could emulate the 040 or not, but either way, there should be lots of multiprocessing in the machine... concurrency is a good thing.)

>That's just silly. Are you saying it wouldn't go faster with both?

About six people left me mail about my posting. I committed a slight faux pas which I must clarify.

It is true that adding a seperate DSP to a PowerMac would allow the PPC chip to perform other tasks better. So why didn't Apple do this? Several reasons. First, adding a seperate DSP would increase the cost of the computer significantly. Second, the DSP wouldn't help as much as many people might think. Yes, it would help - but the cost of adding a DSP to the machine would not be worth the nominal performance incrase you'd be getting from it. (Kinda like selling your 20ms access time hard drive and then buying a 19ms drive of the same capacity. Sure, you'll get a nominal speed boost, but is it really worth it?)

So yes, in my statement that a DSP wouldn't help, I misspoke myself. I would have been more accurate to say that adding a DSP wouldn't be worth the performance boost versus the cost.

I never said it was impossible to make good video games on the Mac; I'd appreciate it if you stopped attempting to put words into my mouth. There are dozens of excellent games on the Mac, but since the market isn't as large as the PC market, and it's not quite as easy to do it on a Mac as, say, an Amiga or ST, there aren't as many.

Please let me know when you're going to stop niggling over every insignificant detail, okay? I *can't* believe that there are such people in this world. Tell me...Have you *EVER* used a Mac for any significant amount of time (read: at least six solid months)? I doubt it. In fact, I doubt that you have any Mac experience other than perhaps fiddling with demo machines in computer stores, etc.

If you wish to lay such significant influence on such insigificant points, I'll be happy to acknowledge the points about the Atari that would make it a poor choice for general computing.

> the Mac market is nothing! Ask any software developer!

Fine...But why are you talking about the PC when the discussion is about the Atari and the Mac?
"Kettle syndrome," as I call it, works like this: It's when you have a person pointing out flaw after flaw after flaw (however insigificant or meaningless it might be) on a given issue/person/computer/whatever, while at the same time ignoring the very same (or worse) flaws on his/her own issue/person/computer/whatever. For example, I often hear talk about how (supposedly) "closed" the Mac architecture is, and most of that talk comes from Atari enthusiasts. However, the Mac has been more "open" to third-party upgrades than the Atari has ever been. Adding RAM to my IIci, for example, is as easy as adding a few SIMMs. Adding it to my 1040ST requires soldering, jumper wires, etc. Atari is the only home computer, so far as I know, that *doesn't* have any sort of expansion card system. Amiga, Apple, IBM and all of its clones all do, yet the Atari loyalsists are lften the first ones to say that everyone else has a closed system. Get it?

> I would rather have a computer that can work with the majority
> of third-party printers. The extra port on the back doesn't
> bother me in the least.

HEAR YE, HEAR YE! PLEASE PAY ATTENTION TO THE FOLLOWING SENTENCE WHICH HAS BEEN POSTED AT LEAST HALF A DOZEN TIMES AND IS WHOLLY IGNORED BY EVERYONE WHO DOESN'T READ IT!
The "majority" of third-party printers, with the exception of dot matrix printers, *DO* work with and are fully compatible with the Macintosh. There are extremely few printers out there that work with *only* the PC, and the majority of that set have Mac-equivalents which are just as easy to find (i.e., DeskJet and DeskWriter).

> Big whoopee! A) Sun's market share is probably about as small as
> Atari's. B) Emulation = SLOW!!, especially on old CISC chips.

Because Sun has no mainstream software. With the application of the Mac OS, it opens up a HUGE window of software to the Sun. And, contrary to what you want to believe, emulation isn't as slow as you think. And aren't SUN-type workstations RISC-based machines?

> It's a long story. Ask sinclap.

If it's a long story ("except it"), I don't think I wanna know.

> I wouldn't be impressed by it either. You still seem to have]
> this strange illusion that I'm MR. ATARI or something, like you're
> MR. MAC. Well, I'm not.

I know that. You don't seem to grasp, however, that this whole discussion is focusing around Macs and Ataris, which is why I continually make those references.

trautt@magritte.its.rpi.edu (Thomas H. Trauth) writes:
>Oops! I forgot about the fire sale that Apple started a short time ago.

Gotta love double standards, y'know? IBM starts the "Ambra" division of discounted retail computers, and that's good. Atari introduces a powerful 68000 based machine (back when the ST was introduced) for less than $1000 and that was outstanding. Apple sells their equipment at discounted prices and suddenly it's a fire sale. Sheesh...

>It's a prelude to the going-out-of-business sale that they'll be having in
>five years! (*Except* it!) Facts... How about all the money they lost
>last year. Oh yeah...about those printer prices again. If I am wrong
>about printer prices, forgive me. It's just that it's hard to find Apple
>(or any Mac) printers in computer magazines -- it's almost like they
>don't exist. What page of the April issue of Byte has Mac printers
>on it? Inquiring minds want to know.

Barring your wishful thinking and unfounded accusations, which I'm really getting tired of...
Byte is, and has always been, PC supportive. Just like Car Craft magazine is, and has always been, Chevy supportive. Look in the pages of Computer Shopper, Home Office Computing, etc and you'll see dozens of ads.
Do me a favor. I know that your message was directed towards sinclap, but PLEASE cut the idiotic sarcasm, will ya? There's enough undirected hostility on this newsgroup; shit like that ("Inquiring minds want to know") isn't helpful and doesn't accomplish anything.

>And how many printers have Appletalk ports anyway?

Hundreds.

>Because by switching to the PPC, they made the Quadras obsolete. Who would
>pay $2954 for an obsolete machine Mr. Clap. Apple's just clearing out their
>inventory.

Obsolute? Puh-LEEZE! Let me ask you this, then: Why are companies still selling 386 machines? They are, after all, obsolete, right? Or even 486 machines for that matter, since the Pentium is available. Hell, NOBODY should buying anything less than a Pentium-based PC according to your "obsolute" theory, right?
68040 Macs are far from obsolete. In fact, 68030 Macs aren't obsolute *for the people that don't need that type of power*. Not everyone needs a PowerPC-based Mac. If all you do is word processing, telecommunicating and maybe balancing your checkbook, do you REALLY need a PowerMac? Or even an 040-based Mac? Hell, you could get by with an 8-bit computer if people still sold 'em!

>PS: I more time. What the heck does 2954 stand for anyway?!

I looked. There's no Biblical reference, so that's out... :)

And haven't I told you, repeatedly, that nobody other than you is
discussing the PC aspect of all this?

>Ah, you finally figured it out, My Lord. And I am well aware of your
>very-MAC-fanatic status. Your like The Clap, but more polite and a lot
>less provokative.

("Your"? Is that like "Except"?)
I am definately not a Mac fanatic. Unlike others here, I recognize the
flaws and faults of my own machine. I don't blindly follow Apple, no
matter what they do. I don't buy a Falcon when I'm tired of my 1040ST
because it's an Atari. I follow many points of logic about my computing
choice, which is a definative mark of non-fanatacism.

>That's because no one's willing to pay big bucks for an obsolete
>computer. If my sources are correct, Apple will be done with the
>040 as of '96, if not sooner.

All Macs will be PowerPC based by '96; that's true. Your hilarious
conjecture that all other Macs are obsolete has been discussed in another
posting.

I am quite aware of the PC's flaws. I'm not one of those diehard fanatics
who thinks his computer is perfect and every other computer is junk. And,
contrary to what you say above, I haven't been totally ignoring them. I've
already mentioned that I think PC sound sucks and PC hard disk installation
is a nightmare. To clear things up, here's a laundry list of my PC pet peeves:

1. DOS in general (and the 640K barrier in particular)
2. Windows 3.x (slow, easy to crash, still not user-friedly enough)
3. Hard disk installation (hopefully will be simplified by PnP)
4. PC sound.
5. The AT bus (fortunately, currently being phased out in favor of PCI)
6. The 101-key "Enhanced" Keyboard (for putting the Ctrl key in a very
unfinger-friendly location)
7. Too slow! (this peeve is specific to my current computer, a 386SX-16)

There are more, but that's all I can think of for now.
By the way, I also think that the new Mac chip (the PowerPC) is superior
to the current (and probably future) Intel chips.

>HEAR YE, HEAR YE! PLEASE PAY ATTENTION TO THE FOLLOWING SENTENCE WHICH

I think you may be right on this one. I checked the manual of my 1993
Epson ActionLaser, and it has both parallel (PC) and serial (I think
Mac) interfaces. If this is true of all laser printers than you are
right and I am wrong (unlike most people around here, like Clap, I can
admit that I made a mistake). However, I still think that is only a
recent development and that a couple of years ago my printer criticism
would have been valid. By the way, dot matrix printers count. Their

obsolete and have few uses today.

>> Big whoopee! A) Sun's market share is probably about as small as

>aren't SUN-type workstations RISC-based machines?

A)
I don't think the MAE will make the masses run to Suns. Workstations
are still much more expensive than personal computers and UNIX is
supposed to be extremely hard to install (and *impossible* to install
for Joe Schmoe). It probably will help their sales to users who want
a computer whose primary role is as a workstation and whose secondary
role is as a personal computer. But users who want that should get
an RS/6000 instead because they, thru MAS, will be able to run Mac PPC
software directly.

B)
I was referring to emulation on the 80x86 here, not on RISC chips
like the Sun SPARC, PPC, or Alpha; all emulation, however, is SLOWER
than the real thing. Case to the point: the PowerMacs are faster
than the 040-based Macs, but run 680x0 software (which includes over
80% of System 7!) at the speed of an 030-based Mac.

>> It's a long story. Ask sinclap.

>If it's a long story ("except it"), I don't think I wanna know.

Here's the abbreviated version. In c.s.amiga.adv, sinclap said that
"C= will not recover, except it!". This started a pathetic flame
war over spelling.

(Note: sinclap happened to be correct in this case; C=, in the US at
least, didn't recover.)

>I know that. You don't seem to grasp, however, that this whole discussion
>is focusing around Macs and Ataris, which is why I continually make those
>references.

I thought that this newgroup had for all intents and purposes become a
Mac newsgroup because all the Mac people had moved here after being
kicked out of c.s.mac.adv by the "Amiga Assholes". :-)

You make a good point, tho. This conservation doesn't really belong
here. The purpose of my original post to this thread was to tell
sinclap to shut up, not to start a PC-vs-Mac debate. Can you please
repost this in a more suitable forum like c.s.mac.adv (with C=USA dead
it shouldn't be to hard to kick the AA's out of it). I'm a newcomer
to the net and have no idea how to do that.

*
* Tom Trauth
* trautt@rpi.edu
* King of the Russians (in Civ)
*

PS: You're really starting to get tough on sinclap. I just read the post where you threatened to get him kicked off the net if he didn't stop posting his BS provacations in c.s.atari.adv. Wow! I never knew it would come to this. I guess he finally either went to far or strained everyone's patience.

Okay, maybe obsolete was too strong a word. How about "old."
People aren't willing to pay as much for "old" computers as new
ones. When the 486s first came out they cost a fortune; now they're
dirt cheap. In a year or two, Pentiums, which as presently expensive,
will become dirt cheap (especially after Intel releases the Sexium,
Hexium, Arbitrarium, Nonsensenamium, or whatever they'll call it).

And nobody other than you and sinclap (not to put you two in the
same basket) gives a damn about Macs here!
(And in case you haven't noticed, you're almost as unpopular on
this newgroup as sinclap is)

>>Ah, you finally figured it out, My Lord. And I am well aware of your
>>very-MAC-fanatic status. Your like The Clap, but more polite and a lot
>>less provokative.

>("Your"? Is that like "Except"?)
Yes, except it didn't start an anal flame war (and hopefully won't)
>I am definately not a Mac fanatic. Unlike others here, I recognize the
>flaws and faults of my own machine. I don't blindly follow Apple, no

Fanaticism doesn't necessarily entail blindness. I'm a Mets fan,
but I don't agree with everything that their front office does or
what their players do.

>All Macs will be PowerPC based by '96; that's true. Your hilarious
>conjecture that all other Macs are obsolete has been discussed in another
>posting.

And what happens to these other Macs when all Mac software is
written for PPC only (I assume that "fat" binaries will be dropped
as the 0x0-based Macs begin to disappear). Will there be PPC
emulation on 0x0's (which would be VERY SLOW!) or will owners
of these machines be unable to get any new Mac software?

Of course, anyone who hates macs has obviously never used one. You see,
they have a little hypnosis/subliminal thing in the startup "shwoom" sound
on the new macs. (The chimes and simple beep of the older ones were not as
effective) so that anyone who listens to it for 6 months or more cannot
help but to love them. Sheesh, thanatos, why is is that everytime someone
posts a complaint about the mac you always respond with "you've never
really used one!" are you that insecure?

How about comparing like machines? How easy is it to add ram to a mac
512k or mac plus? THe STE line, TT and Falcon all have the ability to
take simms. (You need the $99 simm board for the falcon first, though)
You complain about people arguing outdated mac technology against a Falcon, yet
all of your Atari arguments are based on an ancient 1040ST! (kettle syndrome?
I prefer to call it thanatosis) Oh, and the Mega STs had the MegaBUS, which
was not used much, the MegaSTE and TT have a standard VME bus (and there are
many graphics cards out there for them, which is the primary use. Not as
expansive at the others, I will admit, but it does exist) and the Falcon
has a Perocessor Direct slot for adding accelerators, emulators & such.

If you are talking from a comparison with the previous DSP Macs, you
are mostly right. If not, having a DSP around will give the PowerMacs
even more performance.

>and that was outstanding. Apple sells their equipment at discounted
>prices and suddenly it's a fire sale. Sheesh...

The difference is that Atari started out selling them as less expensiv
computers. If you follow sinclap's posts, apple lowers some price every week.
SOunds like a fire sale to me. We're not talking new computers (like the
LC was their Low Cost machine) but constant reducstions on existing models
in order to undercut Clone makers. Atari has rarely if ever lowered the
list price of a machine unless it is reintroducing one (like the recent
STfm sales in europe and maybe (?) the new TT runs)

>68040 Macs are far from obsolete. In fact, 68030 Macs aren't obsolute
>*for the people that don't need that type of power*. Not everyone needs a
>PowerPC-based Mac. If all you do is word processing, telecommunicating
>and maybe balancing your checkbook, do you REALLY need a PowerMac? Or
>even an 040-based Mac? Hell, you could get by with an 8-bit computer if
>people still sold 'em!

Actually, since apple is no longer making any 030 based machines (AFAIK)
then it is "obsolete" from their standpoint. and 040s are now their low-end
chip. I think what the original poster was intending is that the old
quadras (700 900 950 800 etc.) as the "high-end" machines are obsolete.
(i.e. no longer high end) and not a reference to the q605 et al.

Actually, I did not mean that they were lucky to not have money, but perhaps ironically fortunate that their bad financial status at the moment is forcing them to wait out the current wave of chip wars. They could end out ahead since they can take the time to choose the winning side. :)

True. I'd be surprised to see any major computer announcements (like a jag computer. Falcon040 maybe) before 1996. THis could change, but I'll say a year and a half to give them plenty of time to pleasantly surprise me. :) I know my falcon can hold out that long, but I'm getting a 486 within the next few months (SCSI II and external peripherals to share!) to hold me for any "power hungry" moods I might get in...

|>
|> You don't hear too many Mac owners complaining, do you? Sprites are a

My roommates kind of did when they saw my Amiga 500 the first time.
Their jaw just dropped to the floor (Shadow of the Beast). Ah, I still
remember that day :-)

But you know what? You really know how this thing works? Most don't
complain *NOW*, but as soon as the Mac gets similar features, they think
it's the best thing since sliced bread. This is exactly what happened
with Crystal Quest. What was on the Mac a 'revolutionary game' was
on other platforms (Atari and Amiga) just another 'me too' type game.
Kinf of a variation on Robotron.

|> pretty serious handicap (or lack thereof, actually) when programming an
|> arcade game, but it certainly doesn't make it impossible to do so. Like I
|> said before (GADS, AM I TIRED OF #$%^&*(REPEATING MYSELF!!!), the Mac

Don't tire yourself. Count 1 to 10 and calm down. I UNDERSTAND
your point. But, *MY POINT* was that "Mac games suck in generall,
with very few exceptions, which are in fact EXCEPTIONS and are usually
a subset anyway of what's in other platforms." It's not only you
the one who's getting tired :-|

Whether this is because the Mac doesn't have sprites (TOO BAD), dual-playfieds,
Apple policies, etc. THAT's A CAUSE- which is, again, no cure for the
problem- no excuse and part of the conclusion why for people who like
games, the Mac has a minus.

|> was never designed to be a game machine so sprites were never programmed
|> into it.

Hmmm... programmed is not the word for it :-)

|>
|> > One of the very few games on the Mac that I recognize is very good,
|> >has good sounds, atmosphere, etc. is Beyond Dark Castle 1 and Beyond

Do you mean that a Digital Signal Processor is not needed on a PowerMac because the CPU is so fast ?
==========

As a matter of fact, the PPC 601 chip includes the multacc (multiply and accumulate) instruction that DSPs are designed to do very quickly. This is expected to execute about as fast as most DSPs do today. Of course, for the extremely high end user dealing with video information, this will not be good enought so they might use the new TI chip. The PPC 601 should be adequate for all audio and most light-duty video apps, however.

2172. Re: 3d0 or Jaguar?

Newsgroup: comp.sys.atari.advocacy
Date: 1994-05-01 13:05:15 UTC
From: mk5123@pegasus.cc.ucf.edu
Message-ID: <2q09eb$39e@pegasus.cc.ucf.edu>
Source record: 17272
Cross-posted to: comp.sys.amiga.advocacy,comp.sys.atari.advocacy,rec.video.games.3do

It's disappointing to say it, but neither the 3DO nor the Jaguar are going anywhere. About a week ago I read a posting by someone who quoted a west coast newspaper, saying 3DO as a company was running out of cash fast. The machine is much too high priced--just as Neo Geo was.

While the Jaguar isn't as high priced as 3DO, it still is high compared to Sega and SNES. More importantly, there aren't many places selling Jaguars comparatively, AND there is almost no software for the machine.

Here in Florida (about the fourth most populated state) the Jaguar is basically unknown. The only place I've seen selling it is Babbages. With 3 games available there, it's not an attractive buy. Moreover, two salesmen I spoke with recommended that I not buy a Jaguar, as it is too risky an investment.

In short, all the European sales will not make any difference when it comes to the American market. If I had to make a prediction, then it would be that the Jaguar will not amount to anything significant, and Atari might end up in liquidation like Commodore. I say this based on watching the company evolve over a decade. Don't interpret this as something I want to happen. I still own--and will always own--four of the 8-bit Ataris. But I wouldn't buy a game machine with so few software titles available, and the possibility it might amount to nothing.

No, these machines did not meet my needs. Does not mean it did not meet the needs of Amiga users such as video production.

Your the one who is having a spasm over this. Feel insecure?

Evil number? 2954 was issued by my university as a number sequence based on my birthday digits and adding it to the last four digits of my social security number, if you want to know.

>sale bin and if you have NVDI you're a happy. One of the first things
>Atari should do if they release a new TOS/MTOS in ROMs is buy or rewrite
>the damn graphic routines.

Warp 9 for the Falcon is OK. It doesn't make nearly the improvement that it did for the ST's but it's OK. In Mono modes, it makes the machine 1000% its normal speed, but who uses mono? I use 16 colors, and it's STILL slow with Warp 9.

BTW, I've seen all the arguements for and against Atari optimizing their graphics routines, and I can almost guarantee that programs like NVDI and Warp 9 have one routine for each number of bitplanes that the machine can handle. Let me tell you that if you have one routine for each number of bitplanes you can handle for each type of thing you want to do (pixels, lines, characters, fills, etc.), you're going to take up a HELL of a lot of space. The routines in the Atari's ROMs aren't bad, but they're just about as generic as the code I just recently put in this newsgroup to plot a pixel. Atari was getting damn near filling their ROMs for the Falcon, so I know there wasn't room for more specialized routines. Would you like to sacrifice functionality for speed? I realize this is used as an arguement against Ataris by many non-atari users when they get their Macs with display speeds that would bore a sloth to death, but tell us how POWERFUL their flaky huge operating system is compared to ours. Well, there are some times when even WE have to sacrifice a little speed for functionality, so that is what was done. Besides, if Atari optimized their OS, then NVDI and Warp 9 wouldn't sell... that wouldn't be very good for their already dwindling developer base.

I heard that the new version of Of Lasers and Men is REALLY slow, because the
guy tried to put in more degrees of freedom than DOOM has (ie, up and down) to
view in. Additionally, it doesn't work on VGA any more, so it's out for me
right there. If he's just take out that extra degree of freedom, it would
turn out as good as it was before.

>getting from it. (Kinda like selling your 20ms access time hard drive and
>then buying a 19ms drive of the same capacity. Sure, you'll get a nominal
>speed boost, but is it really worth it?)
Also, the PPC chip has DSP functionality built into it (like the
multiply-add instruction) that enables it to perform DSP operations
faster than most chips (including the 80x86s and 680x0s).
>So yes, in my statement that a DSP wouldn't help, I misspoke myself. I

Mark,
I would have to disagree with some of your comments. First of all, the Jag appears to selling very well (over 100,000 so far) and most places claim that they can't keep Jags in stock for more than a couple of days. Also the Jag has over 80 developers so you will see games coming out for it. Doom will be making an appearance soon as well as Alien vs. Predator, Wolfenstein 3D, Club Drive and Mortal Kombat II (according to Die Hard Game Fan). Since this is Atari's last chance to make it I think you'll notice them pulling out all the stops. Just look at the ads!
I do agree that waiting for more games may be a good idea. I do think you'll be pleasantly surprised by Xmas this year. The Jag should have at least 20-30 games available by than and about 500,000 units sold. It will be a tough battle for Sega's Saturn if the Jag is that firmly entrenched. Also, the Jag's price should drop by Xmas to $200.

Well, maybe my opinion of a BIG surprise isn't the same as what some others may thing of as a big surprise, because two of the above are partially true, but the big surprise I had in mind was just vaguely related to one of them. <shrug> Of course, we're really thrilled about it because it's something that we need! Well, ok... it's impressive. I can tell you that. Some may not be surprised by it, but it's impressive.

Boy, I'm really playing it up, ain't I? "Well, it's kinda a big surprise!" <chuckle> Of course, I was only talking about one or two pages. There's the whole rest of the magazine to look forward to. You should have seen this thing that Sean designed... it's really cool looking. :)

2184. Enough of this. Please read.

Newsgroup: comp.sys.atari.advocacy
Date: 1994-05-02 02:17:38 UTC
From: lordthan@news.delphi.com
Message-ID: <2q1ns2$2mk@news.delphi.com>
Source record: 17284

I began to read the 35+ messages that have appeared in this newsgroup in the past 24 hours, but got so thoroughly disgusted with the way some of the people in this group are behaving that I stopped reading after the second or third message. At this point, I really don't care if people take this personally or not because based on many of the attitudes I've experienced here and in my mailbox, I really don't care what those people think. So here's the deal.

I came to this newsgroup for two reasons. I was interested in hearing about the Atari computer and what's going on with it, and I wanted to clear up some misconceptions, slander, and outright lies that were being spread about the Macintosh computer. I've long been supportive of the notion that anyone is free to bash any computer platform he/she wishes to. I have no problem with that; some people have better things to do with their time, but if that's what makes your life worth living, knock yourself out. The only qualification to that is when people start bashing other platforms by giving false or partially complete information about the platform in question.

The latter issue is what resulted in this posting. I had hoped that my continued presence in this newsgroup would ease some of these misconceptions/lies/whatever, but I've discovered that, unfortunately, this isn't to be. I find myself continually confronted with people who insist on sticking to their fabricated accusations, sometimes even to the point of fabricating "facts" to support these ideas. I'm constantly surprised by this, actually; I would imagine that people who choose to stick to a near-orphan computer (and face it, that's what it is in the US) would spend more time exploiting what *their* computers *can* do rather than making up things about what *other* computers *can't* do. Strike two, I was wrong again.

In an effort to stop a great deal of flagrant BS that's being spread around this newsgroup, i wish to make the following promise to comp.sys.atari.advocacy and all of its members. Starting on the time this message is posted, I hereby promise to refrain from making any Macintosh-related postings on this group *unless* one or more of the following criteria is met:

* Someone asks me a direct question about the Macintosh. (Unless a notation is made in the question to reply to mail, my reply will be public.)
* Someone posts erroneous or incomplete information about the Macintosh. (In this case, I will follow up with a ONE MESSAGE reply. I feel that I'm currently one of, if not THE, most qualified Macintosh sources in this newsgroup, or at least the most well informed, and I think I've demonstrated the ability to not "spout off" like certain other Mac

advocates here do. *cough*sinclap*cough*cough*)
* Someone posts what I call an "oh yeah?" message. (I.e., someone posts something like "my ST can sample 16-bit stereo sound, let's see a Mac do THAT!", in which case I'd reply that many Macs *can* do that, with a brief explanation.)

That's it. I don't feel this is unreasonable, and if anyone else here thinks otherwise, please let me know your feelings. I'm interested.

Furthermore, I'd personally appreciate it if a lot of the "Macs go home" sentiment were toned down. I've gotten everything in my mailbox from personal insults to allegations about my intelligence to accusations about my sexual orientation -- all because I happen to own a Macintosh. I don't see any connection, but maybe that should be telling me something. :) The better part, of course, is that these same people apparently forget that I also own one Macintosh, one 1040ST, two 800XL's, one 400, and pieces of a 600XL, and I used to own a lot more Atari stuff than that. The sheer quantity of my Atari stuff far outweighs my Macintosh stuff, yet I'm branded as an idiot. You figure out the logic in that.

If anyone has bothered to read the Atari FAQ, you'd notice that comp.sys.atari.advocacy is for "discussing the pros *and cons* of Atari computers," so discussions comparing Ataris to Macs certainly *DO* belong here. I try not to get involved in computer bashing, relying instead on a simple presentation of factual information and allowing the *objective* person to make his/her own decision, but it seems that this too has caused much dissent.

I could go on and on, but this message is long enough and I think I've made my point. I made a statement shortly after "announcing" my presence here that, over the years, I've found Atari users to be among the most paranoid and/or insecure about their machine choice, and overall I think that's been justified. Here we have a computer company on the brink of oblivion, and their users and complaining about things like no floppy drive buttons, circa-1986 keyboards and other such drivel on the Mac. The most distressing thing, of course, is that the majority of these laughable points come from people who likely have no practical experience on the Mac.

shrug If anyone wishes to reply to this, fine. I wholly expect a barrage of "you don't know anything, you're a shithead, go screw yourself, etc" messages from people who can't stand to let one person have his own opinion on the topic, and I've already made a listing of people who I think will reply. I've got a $5 bet with someone that 50% of the names listed here will make some sort of contradiction, argument, nitpick or other nonsense with this message; don't let me down. :)

Take care, and see you around.

-Steve

PS: I won't be reading any of the existing "war threads" so if anyone has asked me a question or made a statement they wish to discuss with me,

start a new thread.

Let's put it this way, A PowerMac6100 out performs the Falcon with dsp. not
that hard is it?

Whoa big fella!! Down boy! DOWN!!

I find the posting rather interesting! So CBU split off CEL and put it into voluntary liquidation - so someone can buy up the entire electronics side right now !!! - this is interesting.

I hope this helps you get your $5. :-)

On a more serious note, you're right. This PC-vs-Mac-vs-Atari thing has gone way too far. In fact, it has practically taken over this news group! I appologize for my contribution to this mess; I now have nearly ten posts on this newsgroup, none of which has anything to do with the Atari. From here on in, I will refrain from posting anything to this group unless a certain IDIOT FROM IOWA posts more of his mean-spirited BS, and even for those I will tone down my Mac bashing. (BTW you should see what he's posted in c.s.amiga.adv this weekend; he seems to be getting his jollies by rubbing it in to all the Amiga users that C= (and therefore the Amiga) is dead). Let's give this group back to the Atarians!!!

Signing off (so long as Clap finally shuts up!),

No, Commodore Electronics Ltd. (the development portion) is just
being liquidated FIRST. If you read the press release(s) more
thoroughly, you'll notice that it says it's the beginning of the
"liquidation of BOTH companies." Commodore International Ltd.
(the offices/subsidiaries/etc.) WILL go into liquidation later.

<Raist's comments about how well the Jag is doing>
Raist, what do you define as "doing well"? From all accounts
across the country, Jags are selling out as fast as stores
can get them, the Jag is getting good press, and Atari is
advertising. Sounds okay to me. As far as IBM not making
enough Jags I think it is best to wait for the next batch
of games (especially Doom). Atari has no immediate threat
besides 3DO as far as "next generation game systems."

Steve, there are annoying people on every platform as well as
great ones. To say that Atari users are more paranoid than
others may be a little too blanketing. Atari users seem to
get flamed quite a bit for being "idiots" for sticking with
Atari. Before Mac and PC users there were C= users.
However, there are other people (such as myself I hope :-))
who enjoy any discussion on computers as long as it is based
on fact and has the goal to increase knowledge on the subject.
To me, your posts definitely fit this line for the most part.
Sinclap, on the other hand.... By all means, keep in the
discussion. I have already learned a couple of things about
Macs and hopefully you're getting info on the new Ataris
(the TT has a 32MHz 68030 :-)).

Perhaps it is a blanketed statement, but (as I pointed out) that's my
experience. I cannot count how many times people who own Ataris or Amigas
demonstrate some sort of "pity" for Mac or PC users. Conversations like
this make my point stronger:

PERSON 1: "What kind of computer do you use?"
ME: "A Macintosh, mostly."
PERSON 1: "Sorry to hear that. I use an Amiga."
PERSON 2: "An Amiga? *laugh* Get a real computer."
PERSON 3: "What do YOU use?"
PERSON 2: "I've got an Atari Falcon. How about you?"
PERSON 3: "A 486 clone."
PERSON 1 & 2: "My condolences."

If I had a nickel for every time I've heard something along these lines...
But as I said, that is simply my own opinion based on my own experiences.
In comparison, very few PC owners put down Macs or other platforms, while
the majority of Amiga and Atari ownerse *do*. I call that paranoia.

>However, there are other people (such as myself I hope :-))

No, that's just what they're telling the caller on the phone. The
truth is, the doctors who tried to save her have spent the last
5 years telling her to cut out the sweets and red meats because
of her blood pressure, but she ignored them and instead just went
from doctor to doctor (paying with plastic, of course). Now, none
of the doctors at the emergency rescue team could care, and instead
of coming to revive her, they'll swing by later on the way back
from a visit so that they can do an autopsy.

Yes, that is true. The problem was that ATARI couldn't
have the units fast enough or make enough units. In that
regard is that he Jaguar isn't doing well, and hopefully from
my sources, ATARI is solving this problem.

Now, there's another problem ATARI's having: they are
taking too long to come out with good software. Current
Jaguar software doesn't really cut it, except Tempest. But
the problem with Tempest is that it is only one game, and it
doesn't appeal to everybody.

So ATARI's time to position the Jaguar in front is fading
fast... I hope that they do it though. ATARI's last financial
report was putting ATARI exactly in the same direction
where C= is today :-(

Please, dont' take this as a flame.

|> enough Jags I think it is best to wait for the next batch
|> of games (especially Doom). Atari has no immediate threat
|> besides 3DO as far as "next generation game systems."

The Saturn system might debut in the U.S. by christmas
or at least a new Genesis version ("Mars"). SEGA's marketing
alone is enough to bury ATARI if they don't have the games
they need.

|> -scott tirrell

Believe me Scott, I want the Jaguar to do well... I am
pointing out some of its problems, but at least in all the
other areas I can imagine, ATARI has practically solved them.

So we get: distribution and software... that's what
missing right now.

Alien VS. Predator, supposedly due out April has now
been pushed as far as mid June to August!.

Doom is due out late in the summer... see what I mean?

3DO on the other hand is getting the software it needed,
and I know of about 5 people that are considering buying
one now... Or even an SNES or Genesis because of the
software.

Here at work there are several Mac users and several Clone users and they are constantly badgering each other about the others machines. From my experience, the majority of computer science and engineering types are a pretty concieted (sp?) high and mighty lot. Anyone who is into their computer (more than just a casual user) is usually pretty opinionated about their choice of platform and has some degree of disdain for the others. Yes, I know there are a few really open minded multi-platform types out there, but the majority sell themselfes with truth or fiction that their choice was the best (and usually for them it was).

Now, when the guys at work get into a discussion about computers and I try to in throw my $.02 worth, they just roll their eyes and pretty much ignore me (being an Atari users and all).

Steve, back to your original post on this thread - I think your approach is reasonable and if everyone would take it things would remain much calmer around here. What you need to watch out for, though, is when you get into things that involve personal preference. Yeah, the disk eject button may not seem like a big deal to you, but it may be a real peave for someone else and for them it is a perfectly valid reason for not liking the Mac. You can't argue facts on an issue like that.

I've used Macs at work for many years but I still have more fun going home and using my Ataris. Give me all the facts you want, but don't tell me I can't like Atari machines better just because they are not the most popular, powerful, pleasant, price wise pieces of equipment available.

What else is there to talk about ATARI COMPUTERS? Now that Atari has stated numerous times that the Jag is the focus of their time and resources.

Here's a new Atari Topic: Can Atari survive as a one product(ie, the Jag) company?

Peter Sinclair-Day

|> In comparison, very few PC owners put down Macs or other platforms, while
|> the majority of Amiga and Atari ownerse *do*. I call that paranoia.

Paranoia? Or could it be:

Mac owner->"Gee look. We are doing multitasking and multimedia. We basically invented
it."
me-> "Well, actually the Amiga has been doing that for a while..."
guess-> "The Amiga? You mean the $1,000 dollars Nintendo with keyboard? No way!
that's just a game machine"

I think that today, pretty much everybody... except that just plainly
don't care what computer they use. I think that those users exist on
every platform... how explain then the jokes I got about the Amiga computer
in my apartment full of Mac roommates... until I got my A500.... they
just shut up (in general).

(Conceited. Remember "I before E, except after C"?) ;)

>computer (more than just a casual user) is usually pretty opinionated about
>their choice of platform and has some degree of disdain for the others.

Usually, yes. I've found more of that disdainful attitude amongst Atari
and Amiga owners, however. I don't disavow the fact that there are many
Mac and PC users who are just as conceited, but if I put my experiences
on a percentage scale, it seems that ~15-20% of Mac and PC users have
that conceit, while ~80%+ of Atari and Amiga users have it.

>Yes, I know there are a few really open minded multi-platform types out
>there, but the majority sell themselfes with truth or fiction that their
>choice was the best (and usually for them it was).

Proven Fact: The majority of Commodore's and Atari's sales in the past
three years or so have come from repeat customers. Atari, in fact, sold
(by their own admission; I read this in Computer Reseller News not too
long ago) approximately 80% of their Falcons to existing Atari owners.
This does not constitute a solid market OR a growing one.

>Now, when the guys at work get into a discussion about computers and I try
>to in throw my $.02 worth, they just roll their eyes and pretty much ignore
>me (being an Atari users and all).

I used to be the same way. :) I remember, eons ago, when I had my 800XL
how everyone "shunned" me because I didn't have a C-64. It was kinda
tough finding people to trade software with. :)

>Steve, back to your original post on this thread - I think your approach

>the Mac. You can't argue facts on an issue like that.

True, and I agree with that. Yet when I attempt to point out that it's a
matter of personal preference and is often overcome with use, they
suddenly get all defensive and all of a sudden it's the most important
topic in the world, y'know?

>I've used Macs at work for many years but I still have more fun going home
>and using my Ataris. Give me all the facts you want, but don't tell me I
>can't like Atari machines better just because they are not the most popular,
>powerful, pleasant, price wise pieces of equipment available.

I never claimed that anyone shouldn't like their Ataris. Hell, here's a newsflash for you and the rest of the world: I just spent about two months getting my 8-bit up and running. It's out in my hallway right now, perfectly functional; I was playing Star Raiders on it awhile ago (I love that game). Today, I spent about $70 in *floppy disks* for the machine! (300 disks, if you wanted to know.) Why? Because I discovered that age and the (limited exposure to the) elements had caused many disk errors. So when the disks get here, I'll be spending about a week or two sector copying all of my old disks onto fresh, new disks. Hell, I even recruited my Mac and my own artistic talent (I'm a graphic artist) to design and print custom disk and disk sleeve labels. :) So don't tell me I don't like my Atari. ;)

I just posted a reply to this to someone else, whose name I can't
remember if a gun were put to my head. :) In essence, I said that I
don't doubt these sort of people exist on the Mac and PC platforms, it's
just that (in my experience) percentage-wise, far more Atari and Amiga
owners have this paranoia.

(I'll call it an emotional attachment to a computer rather than paranoia.)
I think the reason that there are more in the Amiga/Atari lines is that
because they are smaller/niche market machines, the only ones who know about
them and use them are the ones who "care enough" about their computing
choice to go beyond the norm and pick what they really feel gives them
what they want. I don't want this to sound like a "we know more" or a "you
are just following the herd" post at all. I just mean that for every person
who really looks at all the choices and picks a mac or a PC, there are 9
or so who just buy it because "it's what everyone has" (hence your 10%
figure... I'm basing on that rather than my own experiences)
I know that back in 87 or so, mac people were much more emotional than
these days about their machines.

Now this is just not on. Granted, Peter does post some rubbish, but the post you were flaming was not one of them. He was making the (perfectly valid) point that Atari now seem to have lost all interest in making conmputers and are only making games consoles. Instead of refuting that, you go and insult the guy. Grow up.

<regarding C='s going out of business>
It is a real shame that Atari isn't in the position to take
advantage of C='s fall (no, I'm not gloating; I've owned an Amiga).
If Atari would make a run of cheap STs like they planned to in
the UK they may be able to sell them quite briskly to A500 users
looking at a future with little support. The STs would also sell
nicely to families looking for a cheap first computer. Unfortunately
the Falcon is not that computer. The best scenerio would be a
68020 STe with improved graphics (320 x 200 x 256). I think that
Atari UK is missing out on a great opportunity as they are doing
little but waiting for Jags :-(. WHY couldn't Atari have a low
cost computer like the STe still in production?!

The story I get from most Atari users that use, program, and/or repair other platforms for a living is that when they come home, they want to do something DIFFERENT. They want to relax and putz around and program a computer that isn't a pain in the a$$ to program. They get ENJOYMENT out of using their Ataris, but they get only headaches out of using their PCs and Macs. This is the same story I get every time. From everyone from Atari software developers to the average Joe User. The Atari is a nice computer to use.

I don't suppose anyone else noticed the difference between Atari's 8x16 screen font and the PC's 8x16 font. Well, I wrote a terminal program that put the terminal in a window and lots of other neat stuff, and I made the 8x16 font EXACTLY like the one on a PC, down to the pixel. I used it for a while, and kept wondering why I always got a MASSIVE headache from it, and always went back to using ANSITerm, even with its blocky 4x8 font. Then one day, it hit me. I was using a text editor on the GEM desktop that was using the Atari's system font and I realized that I wasn't getting a headache. "Why am I not getting a headache?" I asked myself. Then I realized that it was the display font. In the PC system font, all horizontal spans are one line thick. On the Atari, all horizontal spans are two lines thick. I thought this was very interesting, so I got into my little font editor I had made for ANSI Link, and began remaking the PC's font, modeling it after the Atari's font slightly, just to make all horizontal spans 2 lines thick. Then I used the termainal for a few hours and did NOT get a headache. Whoever designed the PC's system font did NOT have a clue about making things visually appealing to see and they knoW NOTHING about eye-strain. The guy who designed the font for the Atari obviously DID. An Atari is a relaxing computer to use.

Now, the Mac is a different story... they fonts are all proportionally spaced. This makes for quite a variety of possibilities. I have never gotten a headache from using a terminal program on a Mac, but I can say that I do HATE HATE HATE that UGLY Chicago font they use for the menu bar and most everything else, and I want to puke every time I see a poster or flyer with that font on it because I know there was some dork on an old Mac that didn't know how to change the default font in his wordprocessor (Mac Write?) or page-layout program (A really old version of Page Maker?), so he made the whole thing in Chicago. BLECH!

Yes. That's because the MAJORITY of PC amd Mac users don't have a clue about how their computer works, they hardly know how to turn it on, and they were railroaded into buying it by some slick salesman at Comp USA. Atari and Amiga users, on the other hand, bought their computers with the intent on buying SPECIFICALLY an Atari or Amiga because of some set of very good reasons. I'm not saying that that doesn't happen with Mac or PC users, but they are in the minority. I would say that the PC and Mac zealots are in about the same numbers as Atari and Amiga zealots. The remainder of PC and Mac users don't have a clue about computers, and therefore don't have any idea why they would or would not want to use that particular platform... they just know the media hipe and nothing else. You'll seldom find an Atari user who isn't a programmer..... period! A small FRACTION of PC users have even loaded up GW BASIC intentionally. And about the same fraction of Mac users even bothered to buy (or pirate) a compiler or interpretor.

Randomly pick 10 Atari users, 10 PC users, and 10 Mac users. Be sure to get a REAL randon pick... no bias. Now, put the Atari users on one team and the 20 other guys on the other team and have a programming contest of some sort. Guarangeed, the Atari users would CREAM the PC and Mac users. I would imagine that ONE oft he Atari users wouldn't be a programmer, while one of each of the PC and Mac users would know even the slightest didly about programming.

I agree. Think of all those who DID give a used barf-bag about the Amiga at
Commodore. Dave Haynie, Lew Eggbretch (sp?), etc... Where are they going to
go now? Some may say, "hey, not MY problem." Sure, it's not our problem and
they'll find jobs somewhere else, but the fact remains: they are currently out
of work.

Face the facts: Commodore was 100% ok. The kneebiters (Medhi & Uncle Irv)
are to blame for years of nothing but crap for C=.

Jack Tramiel would have probably made the Amiga into a
major computer player in today's market.

Commodore didn't do anything for the Amiga? Who the hell do
you think manufactured the damn things, the Keebler Elves?

I think we should stop wishing for some miricle company to buy the Amiga
technology. Only an Amiga 3rd party developer would be willing to buy
it for reproduction, and there just isn't enough support for that setup
to last very long. I think that there is a good chance that Utilities Ultd.
could buy the Amiga, but who knows how much that will cost them?

I am not alone!!!!! I remember searching high and low for a way to kill
Chicago font. If you happen to use a mac regularly, look for a utility called
Greg's Buttons. It will kill chicago for you and replace it with either
a thin helvetica or a thick helvetica that is easier to read. It also does
some 3D stuff to the buttons, but that is secondary to killing chicago. In
fact, it kills Chicago Everywhere! In dialogs, in menus, even in your
word processor! :)

A must for any chicago-hater. Oh darn, I posted a mac post here... ;)

>Now, the Mac is a different story... they fonts are all proportionally spaced.

Whoops. Not correct. Most Mac fonts are proportionally spaced, but certainly not all of them. I point you to Monaco, one of the original bitmapped fonts (now existing as a TrueType font) which is a monospaced font and, not coincidentally, the font most used as a default for telecommunications. There's also Courier, the PostScript font, as well as a number of other PostScript fonts (OCR, Orator, Pica Elite, etc).

>program (A really old version of Page Maker?), so he made the whole thing in
>Chicago. BLECH!

Chicago is a default System font, but it's not a default on the programs you list. More often than not, Helvetica, Times, New York or Geneva are set up as default fonts. I've seen some very good uses of Chicago in layout, but not many. It's very "neo-industrial" in design; I see it quite often in layouts that reflect that theme, often accompanied by fonts such as Machine and Lithos.
As a sidenote, it's very easy to change the usage of Chicago in the menu bar (and other areas) with another font. I used to have Helvetica set up as my menu font which worked very nicely; unfortunately, a heirarchial menu program I started using conflicted with the change so I had to axe the Helvetica.

You should be into marketing, you know that? All these years, computer
and software companies have been thriving upon the "ease of use" notion.
Silly them! You should go out and tell them that people don't want a
computer that's easy to use, they want one that you have to sit and
figure out.
This is, obviously, wrong. I asked this once before but never got an
answer: What's so terribly wrong about having a computer that's easy
tose? One that you don't have to know how it works? Honda has been making
incredibly reliable cars for YEARS; I know one person who bought her
Honda about five years ago. She knows Clue Zero about maintaining the
car, only opening the hood to put windshield washer fluid into the
reservoir. Does this lack of knowledge make her any less capable a
driver? No, it doesn't. The company (in her case, Honda) takes care of
all the niggly little details about service and whatnot, just like Apple
takes care of all the niggly little details about using a computer (i.e.,
expansion architecture, System updates, software updates, etc).

>users, on the other hand, bought their computers with the intent on buying
>SPECIFICALLY an Atari or Amiga because of some set of very good reasons. I'm

Usually because they already own an Atari or Amiga. Like I said before,
the vast majority of Atari's customers are Atari owners, which is why
Atari is failing in the computer industry. Part of the reason, anyway.

>not saying that that doesn't happen with Mac or PC users, but they are in the
>minority. I would say that the PC and Mac zealots are in about the same
>numbers as Atari and Amiga zealots. The remainder of PC and Mac users don't

Same numbers, maybe. Same percentages, definately not.

>have a clue about computers, and therefore don't have any idea why they would

I have to contest that notion. I think to own a PC, you have to be VERY
familiar with many aspects about your machine -- moreso than if you were
an Atari or Amiga owner, and MUCH more so than if you were a Mac user.
With a PC, you *MUST* be intimately familiar with your computer in order
to install and/or modify and/or update your OS, install programs, update
or add hardware, etc. If there's a DOS user out there that DOESN'T need
to know how to, for example, change his CONFIG.SYS file (which involves a
great deal more knowledge about computers than most people want to know),
I'd like to meet him.

>or would not want to use that particular platform... they just know the media
>hipe and nothing else. You'll seldom find an Atari user who isn't a
>programmer..... period! A small FRACTION of PC users have even loaded up GW
>BASIC intentionally. And about the same fraction of Mac users even bothered
>to buy (or pirate) a compiler or interpretor.

I know about a dozen Atari users. Out of them, one (a friend Eric) and I
are the only two who know how to program it -- and we've both moved on to
other platforms (me Mac, him PC). I also know how to do some simple
programming on my Mac, while Eric can probably duplicate the code for
Windows in a few hours. ;)
I think you're a bit wrong, though. Just examine the sheer quantity of
shareware available for the PC and tell me there's "a small fraction" of
PC users who know how to program.

>Randomly pick 10 Atari users, 10 PC users, and 10 Mac users. Be sure to get a
>REAL randon pick... no bias. Now, put the Atari users on one team and the 20
>other guys on the other team and have a programming contest of some sort.
>Guarangeed, the Atari users would CREAM the PC and Mac users. I would imagine
>that ONE oft he Atari users wouldn't be a programmer, while one of each of the
>PC and Mac users would know even the slightest didly about programming.

I don't entirely understand what you're getting at. Are you saying that
10 Atari users can program better/more efficiently/whatever than 20 Mac
and PC users? If so, I say...So what? News for ya, kiddo...Quite probably
the reason why there may not be a higher *percentage* of Mac or PC
programmers is because the software is already available. Necessity is
the mother of all things; the Atari community *needs* software, and since
commercial developers aren't looking at it, it falls upon the users to
pick up the slack. That's DEFINATELY not to say that comparable software
on the Mac or PC front doesn't exist, though. It's very possible to set
up, for example, a very competant DTP setup on the Macintosh by relying
STRICTLY on public domain and shareware software.

>cost computer like the STe still in production?!

The type of computer you mention would have to sell for about $400, plus a monitor, in order to be even vaguely successful - and I doubt Atari could do that and still make money. Besides, I doubt it would sell anyway; would you spend ~$400 on a computer that you couldn't easily find software for?

(And before people harsh me on that, let me define "easily" in that respect. Like it or not, the consumer market - where that $400 machine would be headed - likes to see available software lining the shelves next to the machines. Wander into The Wiz, or Sears, or CompUSA. Unless Atari can put software like that on the shelves -- or third parties -- forget it.

^^^^^
Not likely from what I've heard.

I guess you failed to notice the meanness of sinclap's post. That's what
I was objecting to, not any info (and I could find none) that may have
been in it. Marc Barrett also makes a lot of perfectly valid points:
his numerous predictions that C= would go bankrupt came to pass. Do you
consider his posts to be informative or inflammatory? Probably inflam-
matory, right. Well, so are sinclap's. In short, even tho he posts
things that may be informative, their intent is to be inflammatory.

Speaking of information, here's some for you: The Amiga is for all intents
and purposes dead! Anyone who buys an Amiga now (assuming they
can find one) is stupid because they can (with C='s death) expect
no support and (with a small user base and imminent disappearance)
little future software.

Note: The above is meant to help get my point across, not to flame Amiga users, who are suffering enough right now.

Hope the Amiga somehow recovers.

Well, here's another idea: what would happen if they put the OS in the public domain? That way, all those people who really loved the system could rewrite it to work on other hardware.

I can think of too many reasons it won't happen though.

Tom

Oh, give me a break. Do you think we're stupid? Of course, there are monospaced fonts. However, there is no restriction to monospaced fonts for the system font or the generally used screen font like there is on the Atari in most GEM stuff and the PC in DOS text mode. There was absolutely no need for you to respond to the above comment about proportionally spaced fonts, since we're all smart enough to realize that whenever you can do proportionally spaced fonts, then you can do monospaced fonts, but not necessarily the other way around. I made a slight technical error in saying that they're ALL proportionally spaced, but we're all smart enough to follow the line of reasoning that I was making and not get bogged down (like you did) with trivial little things that no one is stupid enough to be confused by. Do not get distracted by trivial, pointless things... it's just annoying.

[Irritating car analogy deleted]

There is nothing wrong with a computer that is easy to use. What we're telling you is that for us, a computer that restricts us because the designers figured we didn't have a clue is NOT easy to use because it's FRUSTRATING. A Mac is FRUSTRATING to use! That's why we people who have a clue like to go home to our Atari's that let us do what we want and RELAX.

Actually, this is as often untrue as it is true. Some people buy Atari computers because they're good machines, and not because of some religious following they group themselves with. Atari's make me money. I am the technical editor of an Atari magazine that uses Atari's and Calamus SL to produce a magazine. I'm sticking with my Atari.

Are you the guy who didn't like Calamus SL and said it was only good for small scale stuff? Then why is it that it's to easy for us to produce everything from full color brochures to oversized magazines?

Not to OWN a PC. To do anything TO a PC, you have to be intimately familiar with them. That's why people make so much money suckering people into buying PC's so they'll come back when they discover that they don't know how to install their new card and get charged even more money. Most PC user will never take a screwdriver near their computer because they don't know what's inside. When they want something new added, they pay someone to put it in. I know, because people have paid me money to do just that. They didn't even know what kind of screw driver I needed. Pity.

-> What else is there to talk about ATARI COMPUTERS? Now that Atari has
-> stated numerous times that the Jag is the focus of their time and
-> resources.

By that, you're claiming that the purpose of this newsgroup is to talk exclusively about anything that's *new* in the world of Atari Computers, and that just isn't the case. This is to talk about the computers in *general*, weighing the pros and cons of the machines. It is, after all, an *Atari* *advocasy* newsgroup, not a Mac chat forum, not a let's-flame-Atari-because-everyone's-opinion-here-is-invalid-because-they-differ-from-my-own forum. So they're focusing on the Jaguar for the time being. Good! I have absolutely no problems with that. That is where their most lucrative source of funds is going to come from, and those funds will, in part, be funneled into their comptuers.

-> Here's a new Atari Topic: Can Atari survive as a one product(ie, the
-> Jag) company?

That's quite a presumptuous statement to make, and smells remarkably like flamebait. But since you asked, why not? What else does Sega make besides video games? Nintendo? 3DO? The fact is, the video games market is a highly lucrative one. Atari could survive on that market alone. They have the knowhow. They have the product. And it's out, and surpasses everything else out there in terms of power, performance and affordability. This is not a point of discussion, it's simply a fact.
Will Atari be _forced_ to survive as a one-product company? Highly doubtful. But your nearsightedness and single-mindedness, which seems to be stuck irrevocably on the Mac track, would very likely have you believe otherwise. Believe as you will. I'm not going to try and change your mind or make you "see the errors of your ways" because it's fairly obvious that you've made a decision that makes you happy. All very fine and well, more power to you. Just stop trying to force your opinions on everyone else. We've all made choices that make *us* happy, and if you can't live with that, then perhaps you should find some other newsgroup to aim your flamethrower at.

A 68000 running at 16 MHz with 320 x 200 x 256 and 640 x 400 x 16
selling at about 400 UK pounds would be nice. :-)

Actually, the main probelm with Marc is that he doesnj't contain his posts to the advocacy groups, but his flames spill out into other groups (such as Amiga misc). This is what most people object to.

<Steve's comments about the viability of a low cost Atari computer>
Actually I was talking more about Europe where there still is quite
a bit of software. Right now the STe (1 meg/no hard drive) costs
$399 in the US from Toad and it can be hooked up to a television
(negating the need for a monitor). This WOULD be successful
appealing to families wanting a low cost computer. A 1 meg STe
is fine for graphics, word processing, games, some DTP and
programming. Sounds like the perfect home computer to me. Not
to mention that an STe is simple to use.

Hm... Like a MegaSTE engine and TT-like graphics... Actually, that's even
lower than TT graphics, it could be done... I know that Atari was once talking
about a "little brother" to the Falcon. How about:

Codename: Pigeon
68000 @ 16 mhz
Falcon-compatable graphics, but only for 640 x 480 x 16 and 320 x 240 x 256
16 bit stereo sound playback, but no recording or DSP
STE-type case.
possible internal IDE Drive
Same ports as Falcon, but no DSP

For about $500 with drive, I think it could work

Still it is nothing to laugh about when people suddenly get fired... I have
to agree that companies 'die all the time', but just because it 'isn't your
favorit one' doesn't justify that you are laughing about it...

Not-so-new newsflash: You can buy an 040-based Mac system, complete with monitor and printer, for less than $1000. That's less than a comparable Atari system, and less than some PC systems. I type at ~85wpm on a 25Mhz 030 system and it keeps up fine; the 040 system shouldn't have much difficulty.

Knock yourself out. Atari's own market research, however, proves my point that the vast majority of Atari customers are existing Atari customers.

>Are you the guy who didn't like Calamus SL and said it was only good for small
>scale stuff? Then why is it that it's to easy for us to produce everything
>from full color brochures to oversized magazines?

Yes, that was me. A can name a number of reasons, none of which you'll probably agree with. You run an Atari magazine, so you want to use Atari computers. No surprise there. You probably also never tried using anything *but* an Atari for a significant amount of time, so you have no *real* experience on any other platform and program. It's easy to say "such-and-such is the best" when you don't have experience elsewhere. I never said that Calamus couldn't do stuff like you mentioned. I said that I've used the program and it doesn't really compare with programs like QuarkXPress (which I use) and PageMaker on the Mac (and PC). The latter programs are geared towards the middle and high-end desktop publisher, while Calamus is geared more towards the lower and middle end.

I only know what Macs I've used, and only expensive 040 models had graphics and text displays that weren't sickeningly slow. I've been used them extensively at school and have checked out ever kind of Mac you can think of in various computer stores.

It's not laughable. Some of the frustration I get from the Mac is some of the features that I consider to be counterintuitive. The way the menu bars work, for example, I don't like, for example. Much of the frustration comes from personal preference. The Mac also seems to require a lot more mouse movement over larger areas than the Atari does. That's probably due mostly to the way developers write things. People who know how to write good user interfaces try to keep the mouse movement down between places one must click. And about the menu bar, you have to be more careful with the Mac... if you accidentially let up, you may make a bad selection. With the Atari, the only problem is that people new to the machine accidentally will drop menus down when moving the mouse to the top of the screen, but that takes about a week to get over.

>experience on any other platform and program. It's easy to say

I this is pure and total bullshit. I have used Macs extensively and PC's even more. I know what things are, I know what they're made of, and I know how they work. Sean, the publisher, has used just about every desktop publisher he could get his hands on for trial purposes. He would sit at friends' computers or store models, working with any DTP program that he could get them to let him use and he would lay something out, just to see how easy or difficult it was. He could give you a disertation on why he hates QuarkXpress and likes Calamus SL so much better.

Sean has had quite a bit of experience using Macs and repairing/upgrading PC, while I have worked as a network administator for a LAN and did software development and wordprocessing for a defense contracting firm. We both have also had a lot of experience with people like you who insist that we must be some sort of morons for liking our Ataris so much and we have heard all the agruements people use to tell us why PC's and Macs are so much better. We've heard it all, and we've done it all, and through all of it, we stick to our Ataris because we like them a whole hell of a lot better.

You keep assuming that we Atari users are stuck in our own little worlds and that we have used nothing else, when in fact, a great many Atari users have used everything else and that is WHY they bought their Atari. You really should stop insulting our intelligence. Atari user does not equal ignorant fool.

>

WE HAVE compared Calamus SL to the other programs, and we know that it's better, because unlike you, apparently, we have tried to do everything you can think of with DTP software.

Let me take a moment to explain Sean Dougherty. He is nothing short of pure genius. He learns at an astonishing rate and has practically a photographic memory. His analytical skills are beyond genius, and he thinks fast. He knows more about desktop publishing than most DTP developers. He can learn a complex programming language and all of its little nuances in a few hours. Every time I turn around, Sean astonishes me. It's taken me quite a long time to figure out just HOW brilliant this guy is. He runs Two Worlds Publishing, comes up with 80% of the ideas, does at least 60% of the work (which is divided among 3 people), does all the layout for the magazine singlehandedly, and keeps track of such tremendous volumes of information that I would be crushed by 10% of it if I had written it down!

Now, here we have Sean Dougherty evaluating DTP software. He uses QuarkXpress a few times for varous things and decides that, "The user interface is neat looking, but in order to do anything, you have to put all these toolbars on the desktop, and they get buried under things and hard to find when you need them." Calamus SL takes less work for the user to tell it to do anything than anything else he has used. 2 or 3 click, a number, press return, and BAM, you have an object rotated to a precision of some small fraction of a degree. What other DTP does color seperation so well? What other DTP can zoom in to 999,999%? What DTP has modules to do anything and such an easy way of getting at them? You name it, and Calamus SL can do it. Considering the respect that I have gained for Sean in the past 5 years, if he's used everything else and says that Calamus SL is the best, I can take his word for it. Fortunately for skeptics like you, I HAVE used other DTP programs, despite the fact that layout isn't my job in TWP, and I can tell you some of the same things.

If you want to know something about Calamus SL, I suggest you mail pdirect@delphi.com and ask him about it. I dare you, or are you too worried that he'll show you to be wrong? When you talk to him, come back and tell us what he said.

Steve, have you used Calamus _SL_? Just curious since I've heard wonderful things about it and you seem unimpressed. Are you talking about Calamus (early B&W version)? There are supposedly a few non-Atari magazines that use Atari TTs to produce their magazines. I heard about Boregas (sp?) which is a Canadian national park publication awhile back.

Yes, I've used Calamus SL on, if I'm not mistaken, an Atari TT. (I've
also used the early B&W version, which I was even less impressed with.)
Don't get me wrong -- Calamus SL (which I usually refer to as just
"Calamus") is a good program. It's just not, IM-professional-O, up to par
with the major DTP players that are around now (XPress and PageMaker,
most notably).

>and text displays that weren't sickeningly slow. I've been used them
>extensively at school and have checked out ever kind of Mac you can think of
>in various computer stores.

The only thing I can suggest is that the machines had some sort of
problem with the way they were set up. All 040-based Macs have *always*
had faster-than-other-Mac on-board video, so if my 25Mhz 030 (w/on-board
video, which is slower than a dedicated video card) can keep up with my
typing, then something was DEFINATELY wrong with the systems you were
working on.
The only time I experience severe video lag is when I work with
video-intensive programs, like Photoshop (w/color images; greyscale and
mono images isn't that big of a deal).

>It's not laughable. Some of the frustration I get from the Mac is some of the

Actually, I find myself going to the mouse more with an Atari than on my
Mac. *shrug* Most of what you're saying seems to fall under personal
preference anyway. (And BTW, if you want "Atari-like" menus on the Mac,
there's at least three or four Extensions which will permit it.)
Honestly, the biggest pain-in-the-butt that I encountered when first
working with the Atari was the fact that if you move the mouse a wee bit
too high, the menu drops down. Duh. If I want the menu, I'll click for
it. (My opinion.)

>Calamus SL so much better.

Probably because XPress is a high-end DTP program, and as such is a bit more difficult to master, whereas Calamus is more in the low-to-midrange, so it's a bit easier to master. Quark, in case you don't know, produces the Scitex graphics workstation system. (If you don't know what Scitex is, this probably won't make any sense to you.) XPress is at the heart of the Scitex workstation. That's gotta say something for the power level of XPress.

>Sean has had quite a bit of experience using Macs and repairing/upgrading PC,

DO NOT PUT WORDS INTO MY MOUTH EVER AGAIN.
I have *NEVER, EVER* said that I insist that you must be morons for liking your Ataris. Pull that shit RIGHT OUT of the conversation RIGHT NOW. I'm not in the mood to AGAIN hear all these things about what I supposedly had said.

>You keep assuming that we Atari users are stuck in our own little worlds and
>that we have used nothing else, when in fact, a great many Atari users have
>used everything else and that is WHY they bought their Atari. You really
>should stop insulting our intelligence. Atari user does not equal ignorant
>fool.

See above paragraph. The primary people who I consider ignorant fools are those who need to lie and/or put words into other people's mouths. I DEFY you to show me where I said that Atari users are ignorant fools.

>WE HAVE compared Calamus SL to the other programs, and we know that it's
>better, because unlike you, apparently, we have tried to do everything you
>can think of with DTP software.

I've been involved in the professional DTP field for almost a decade. DON'T tell me what I have and haven't done. In the professional marketplace (which is where it matters), Calamus falls flat on its face. PERIOD. Believe me when I say that graphic artists are a fickle bunch. They could use something for fifty years, religiously, and if someone comes along with something better they'll switch. Instantly. Calamus hasn't proven itself to be at that level.

>>ego-stroking Sean Dougherty deleted<<
So let me get this straight...You take the *opinion* of one person in one business over the combined opinions of hundreds of thousands of people and businesses? The opinion of one man over a multi-million dollar marketplace? One man's viewpoint -- that goes against the tried and true, demonstrated practices of all these people? I'll leave it to you to spot the foolishness in that. Personally, I'm laughing. :)

>If you want to know something about Calamus SL, I suggest you mail
>pdirect@delphi.com and ask him about it. I dare you, or are you too worried
>that he'll show you to be wrong? When you talk to him, come back and tell us
>what he said.

This gets funnier every line. "You dare me," ooooooooohhhhh. I'm
scaaaaaaared. Puh-leeze. Go hang out with sinclap or something.
Who, before I send mail, is "pdirect", and exactly what am I supposed to
ask him that you think will make me think I'm wrong?

First of all, let's get this straight. It's not a matter that *I* may be
wrong. My solitary opinion is meaningless. Take a look at the
marketplace. Take a look at what professionals are using. Take a look at
what large industry is using. Take a look at what the vast majority of
the home market is using. You think the majority of them are using
PageMaker and XPress because of some fluke? Because of some clever
marketing, a lucky strike somewhere? Because it's the only thing around?
Come ON, man. Get real! What you're saying, in essence, is that these
hundreds of thousands -- MILLIONS -- of people and businesses are using
an inferior product? I don't THINK so, Stimpy! More likely, they're using
a superior product that they can get tons of support for, that does at
least everything they want to do (exception: neither PageMaker nor XPress
works well with large book-type publications; FrameMaker, available for
PC and Mac, is the program of choice for that type of work), and that
the rest of the industry agrees with. There's no fluke about it; in the
computer marketplace, a superior product more often than not becomes
accepted by the masses.

Unfortunately, with the GEM Desktop, it's all or nothing. You either view all
files as text or all as icons. The other problem with the GEM Desktop is that
all the dialogue boxes are modal. (At least in the last version of TOS I've
seen, which is 3.06.)

The GEM Desktop and the Finder are pretty similar. Remember, GEM was modeled
after the Macintosh OS.

You ask the wrong question and imply something that isn't true.

There is nothing wrong with a machine that is easy to use. The Atari machines are in fact very easy to use. I frequently use Macs, Windoze and GEM and prefer GEM. It has point and click (just like a mac) drag and drop (just like a mac) desktop-installable applications (just like a mac) and---from a completely personal point of view---a better drop down menu systsem than Macs or PCs.

Atari users, I contend, have ease of use but also a much better knowledge of their machines and a much larger interest in the potential of the machine.

In missing that simple but important hook (the hook that reeled me in afterall :>) you are blinded to the plus points of the Atari range.

>business over the combined opinions of hundreds of thousands of people
>and businesses?

Do you know the opinions of all these hundreds of thousands of people? Are you just guessing their satisfaction? Maybe theses unlucky souls have just never used Calamus sl! I think you have just laid a rather heavy duty assumption on us.

And in anycase commercial success does not imply that something is *better* than another. Many people, for example, feel PCs are kludges, but that doesn't stop them from being dominant.

Sinclap does on about sales as if that proves a thing...It doesn't prove anything except that sales were big.

Ummmm.... I think we all should just settle down. Enough flames.
Steve,
As to your argument about people not using what is best I would
have to say that that is silly. Regardless of the millions of
people using Windows (the standard argument), you also have to
remember that many people haven't tried Calamus SL on a TT.
Blame Atari for lack of marketing, not DMC for a poor product.
I have heard many stories of people getting the job done better
and faster with Atari DTP systems than with Mac DTP systems.
The reason I don't hear the other side of the story is probably
because of the fact I mentioned- Mac users haven't heard
about Atari systems. However, people that are earning livings
with DTP on the Atari all seem to agree that Calamus SL is just
as good, if not better, than DTP packages on other platforms.
Steve, could it be that you just prefer Quark on a personal level
and that it has nothing to do with the power of Calamus SL? I
mean, what is it on Quark that you use that you don't think
can be done in Calamus SL? We should name some features and see
if they are supported by these packages. Just a thought....

I never said that Ataris weren't easy to use. I simply contend that
they're not as easy to use as the Mac. Apple controls nearly all aspects
of the OS and how it works; they have published guidelines describing how
applications should look and work. Which is, of course, one of the beauty
things about the Mac. If you can learn one program in one field, you have
a pretty decent idea of how other programs in that field will work, and
you also know the "universal" commands that are identical on all
programs. It's not *mandatory* that you follow those guidelines that
Apple provides, of course, but history has proven to developers that if
you don't, the buying public won't like it and it'll fail.
The Atari, from what I've seen, has nothing like that. There's little
that's truly *standardized* across the board like that. I find it
interesting that you use the phrase "like a Mac" so much, too.

>Atari users, I contend, have ease of use but also a much better knowledge
>of their machines and a much larger interest in the potential of the machine.

I agree with this. As I said before, though, it's knowledge and interest
gained out of desperation. If you have no developers to turn to, you have
to turn to yourself and the other users for support and programming. I've
always contended that there was tons of potential in the Atari line;
Atari, however, decided not to follow up on it. IMO, Atari was stupid in
releasing the Falcon. Sure it's a halfway decent machine (too expensive,
IMO, for what you get), but Atari would have been WORLDS better off if
they had instead spent some or all of that money on advertising and
getting major developers to program for it. Once you've got a solid
software base, THEN develop and release the Falcon. The most whiz-bang
computer in the universe isn't worth a lick if it doesn't have any
software for it. (And before someone whines about how many programs are
available for the Atari, let me clarify: Take a look at how much software
is available for the Mac and PC and compare it to Atari software. In
comparison, there is almost no software for the Atari.)

>In missing that simple but important hook (the hook that reeled me in
>afterall :>) you are blinded to the plus points of the Atari range.

No, I'm well aware of the plus points of the Atari. However good they
are, they don't (IMO) compare to the minus points. There's (in my

experience and observation) almost no quality customer support, there's no major software developer releasing software for it, Atari has all but abandoned the US computer marketplace, and I can't get truly local, good Atari support. To me, that FAR outweighs the combined good points of the Atari. Sure, I still own and use my Atari, but at this point it's more a game machine than anything else.

-Steve

laugh
I was using my own experience for reference. I have *yet* to hear of any major DTP user switching from a Mac to an Atari for DTP'ing. It's simply not done in the professional (high-level) and (for the most part) mid-level areas. I DO know of about a dozen former Atari users who switched to Macs, though.
The point of my message was not about psychology but reality. In reality, scant few Atari users have truly *used* a Mac for a significant amount of time, and the majority of those that have are already biased against the Mac for one reason or another (like the floppy drive or something).
Now I'm gonna get a couple of letters telling me about how such-and-such knows thirteen billion Atari users who have used Macs, etc soforth and so on.....*sigh*....

>you are ignorant'' message.

Quark is very powerful, true. Much of that power relates to high-end
publishing. If you don't need high-end publishing, there's a generous
compliment of mid-level, easy-to-use commands.
I don't know what you're getting at with your message, but (since you
missed it) I was accused of saying something which I never said, and I
thoroughly despise that. *IF* I believe that Atari users were morons and
incompetants, then I would have SAID that. Simple logic, no? I don't
often imply things, and when I do, it's crystal clear. In no way, ever,
did I say or imply anything of the sort I was accused of. TAHT is what
sparked my anger.

>You may not mean to be saying this, but you are. Very loudly and very clearly.

No, I'm not. Here's loud and clear, for your reference:
ALL ATARI USERS ARE MORONS AND INCOMPETANTS.
If this is what I believed (I don't), I would have said it. Period.

>Do you know the opinions of all these hundreds of thousands of people?
>Are you just guessing their satisfaction? Maybe theses unlucky souls
>have just never used Calamus sl! I think you have just laid a rather
>heavy duty assumption on us.

Chances are, they haven't used Calamus. But like I said - which you
apparently missed - graphic artists are a fickle lot. All it takes is a
small group of people to make a big wave about a program, and it suddenly
gets lots of attention. I'm sure that SOMEWHERE out there are people in
the industry who like Calamus, and wherever they are, they made a few
waves about it. Other people have tried it (it's been reviewed, in fact,
in some trade magazines; it faired average, gaining three out of five
stars in the rating system used, on the average) and it failed to gain
acceptance. I didn't decide this, the market did.

>And in anycase commercial success does not imply that something is
>*better* than another. Many people, for example, feel PCs are
>kludges, but that doesn't stop them from being dominant.

Here's the fundamental difference in philosophy, I think. You seem to contend that Calamus IS better, but it hasn't caught on for one reason or another, none of which relate to the quality of the program. I - and the marketplace - contend that Calamus IS NOT better, and that it's failure as a professional-level tool is due to a combination of what the program cannot do (or does poorly, or at least less-better (bad grammar, I know) than other programs) and what the company providing the platform cannot accomplish. An excellent program on a poorly supported machine isn't going anywhere, no matter how whiz-bang the program might be.
You're right, to a point. Commercial success doesn't imply greatness. However, it's an excellent benchmark. If Rubik's Cube didn't sell like it did, and didn't start the trend like it did, it would have been considered a failure. The same thing goes for all other commercial ventures; Pugeot and Renault pulled out of the US market a few years ago, yet people still contend that they're outstanding cars. A *few* people. The FACT of the matter is that the marketplace does indeed define what is better than the rest, or at least better marketed. Marketing has little, however, to do with the success of programs like XPress. In fact, Quark hasn't taken out an advertisement in a major Mac magazine for a couple years, other than to announce a new version release. Yet XPress is consistantly one of the top-selling programs.

>Sinclap does on about sales as if that proves a thing...It doesn't prove
>anything except that sales were big.

Big sales = successful product. Any student of business philosophy will attest to that. If you have one program that sells 100 copies, and a second program that sells 50,000,000, which do you think is going to be the better program? Most likely, the one that the market likes better. Actually, here's an interesting question: If XPress was available for the Atari, do you think it would succeed? Or if Calamus was available for the Mac, do you think it would succeed?

>I don't know---what do you think?

I think that PageMaker and XPress are demonstratably superior to Calamus. I've used both in similar capacities, and as I've said before, Calamus doesn't compare. And to answer my own above question, I think XPress would fail on the Atari, just like Calamus would fail on the Mac. Why? First, like I said before, a program's success is partially contingent on the platform it's run on. The Atari is a less-than-desirable machine (IMO) because of its lack of support; a desktop publisher won't want to buy a machine with that little support. So XPress wouldn't fly because the platform is going nowhere.
Calamus would fail on the Mac because it lacks in features. At one point, there was about a dozen DTP programs on the Mac. Today, there's four (PageMaker, QuarkXPress, FrameMaker, and Ready Set Go). XPress and PM fight for the largest area of the marketplace, while FrameMaker dominates the large-format-document market, and Ready Set Go (which has died and

been resurrected twice) continues to fight for the entry level market (which PageMaker has a very strong foothold in). Calamus is roughly equivalent to Ready Set Go, and there's already lots of fierce competition there.

>Nah, good marketing, popularity, fashion---these can make or break a product
>without any reference to it's actual ability.

They can, true, but in this case it's not a factor.

>I'm not saying that Calamus is better than Quark as I don't use DTP at all.
>I am just pointing out your logic is full of holes and assumptions.
>Try a different route. Why not go for a feature by feature comparison.

I'm going by my own experience, buffeted by market (and professional) preference. If I had Calamus right in front of me, I'd gladly give a comparison. It's pointless, IMO, but if it makes you happier...

-Steve
